Hazardous waste codes presented in individual Toxic Information Profiles are defined below.

- B001 PCB Oil (concentrated) from transformers, capacitors, etc.
- B002 Petroleum oil or other liquid containing 50 ppm or greater of PCBs but less than 500 ppm PCBs. This includes oil from electrical equipment whose PCB concentration is unknown, except for circuit breakers, reclosers and cable.
- B003 Petroleum oil or other liquid containing 500 ppm or greater of PCBs.
- B007 Other PCB Wastes including contaminated soil, solids, sludges, clothing, rags, and dredge material.
- B008
- D001 Solid waste that exhibits the characteristic of ignitability, but is not listed under any other hazardous waste code.
- D002 Solid waste that exhibits the characteristic of corrosivity, but is not listed under any other hazardous waste code.
- D003 Solid waste that exhibits the characteristic of reactivity, but is not listed under any other hazardous waste code.
- D004 Arsenic
- D006 Cadmium
- D007 Chromium
- D008 Lead
- D009 Mercury
- D011 Silver
- D018 BENZENE
- D022 Chloroform
- F001 The following spent halogenated solvents used in degreasing: Tetrachloroethylene, trichloroethylene, methylene chloride, 1,1,1-trichloroethane, carbon tetrachloride, and chlorinated fluorocarbons; all spent solvent mixtures/blends used in degreasing containing, before use, a total of ten percent or more (by volume) of one or more of the above halogenated solvents or those solvents listed in F002, F004, and F005; and still bottoms from the recovery of these spent solvents and spent solvent mixtures. (T)
- F002 The following spent halogenated solvents: Tetrachloroethylene, methylene chloride, trichloroethylene, 1,1,1-trichloroethane, chlorobenzene, 1,1,2-trichloro-1,2,2-trifluoroethane, ortho-dichlorobenzene, trichlorofluoromethane, and 1,1,2-trichloroethane; all spent solvent mixtures/blends containing, before use, a total of ten percent or more (by volume) of one or more of the above halogenated solvents or those listed in F001, F004, or F005; and still bottoms from the

recovery of these spent solvents and spent solvent mixtures. (T)

- F003 The following spent non-halogenated solvents: Xylene, acetone, ethyl acetate, ethyl benzene, ethyl ether, methyl isobutyl ketone, n-butyl alcohol, cyclohexanone, and methanol; all spent solvent mixtures/blends containing, before use, only the above spent non-halogenated solvents; and all spent solvent mixtures/blends containing, before use, one or more of the above non-halogenated solvents, and, a total of ten percent or more (by volume) of one or more of those solvents listed in F001, F002, F004, and F005; and still bottoms from the recovery of these spent solvents and spent solvent mixtures. (I)*
- F004 The following spent non-halogenated solvents: Cresols and cresylic acid, and nitrobenzene; all spent solvent mixtures/blends containing, before use, a total of ten percent or more (by volume) of one or more of the above non-halogenated solvents or those solvents listed in F001, F002, and F005; and still bottoms from the recovery of these spent solvents and spent solvent mixtures. (T)
- F005 The following spent non-halogenated solvents: Toluene, methyl ethyl ketone, carbon disulfide, isobutanol, pyridine, benzene, 2-ethoxyethanol, and 2-nitropropane; all spent solvent mixtures/blends containing, before use, a total of ten percent or more (by volume) of one or more of the above non-halogenated solvents or those solvents listed in F001, F002, or F004; and still bottoms from the recovery of these spent solvents and spent solvent mixtures. (I,T)
- F027 Discarded unused formulations containing tri-, tetra-, or pentachlorophenol or discarded unused formulations containing compounds derived from these chlorophenols. (This listing does not include formulations containing Hexachlorophene synthesized from prepurified 2,4,5-trichlorophenol as the sole component.) (H)
- P012 Arsenic oxide As_2O_3
- P030 Cyanides (soluble cyanide salts), not otherwise specified
- P087 Osmium oxide OsO_4 , (T-4)-
- P106 Sodium cyanide $Na(CN)$
- P108 Strychnine, & salts
- U002 Acetone (I)
- U007 Acrylamide
- U012 Aniline (I,T)
- U019 Benzene (I,T)
- U021 Benzidine
- U044 Chloroform

U069 1,2-Benzenedicarboxylic acid, dibutyl ester
U072 Benzene, 1,4-dichloro-
U077 Ethane, 1,2-dichloro-
U080 Methylene chloride
U108 1,4-Diethyleneoxide

How Toxic Site Locations Are Mapped

Toxics Targeting maps toxic site locations on a digital version of the U. S. Census map or those used by local authorities using addresses and map coordinates provided by site owners/operators or government agencies. In order to allow site locations to be verified independently, the information used to map each site is presented in the first section of each Toxic Site Profile, along with a description of the mapping technique used and any address corrections that were made in order to locate toxic sites with incomplete or inadequate site location information. The mapping process is explained below.

Map Identification Number: 12

Site Name: Acme World Manufacturing, Inc.

Site Address: 55 Main Street

Anytown, NY 11797

MAP LOCATION INFORMATION

Site location mapped by:

Address Matching

Note: Some sites have an address match location and a map coordinate location. Both locations are mapped because they can be equally correct.

or Map Coordinate

or Manual Mapping

or Site Visit

1) Most toxic sites are mapped by matching addresses provided by site owners/operators or government agencies with locations on a digital version of the street or parcel map. These site locations are identified with the method used to map them.

2) Some toxic sites are located using map coordinates provided by site owners/operators or government agencies. These site locations are identified "map coordinate." Map coordinates for Toxic Wastewater Discharges, Toxic Release Inventory sites and Major Oil Storage Facilities should be considered suspect.

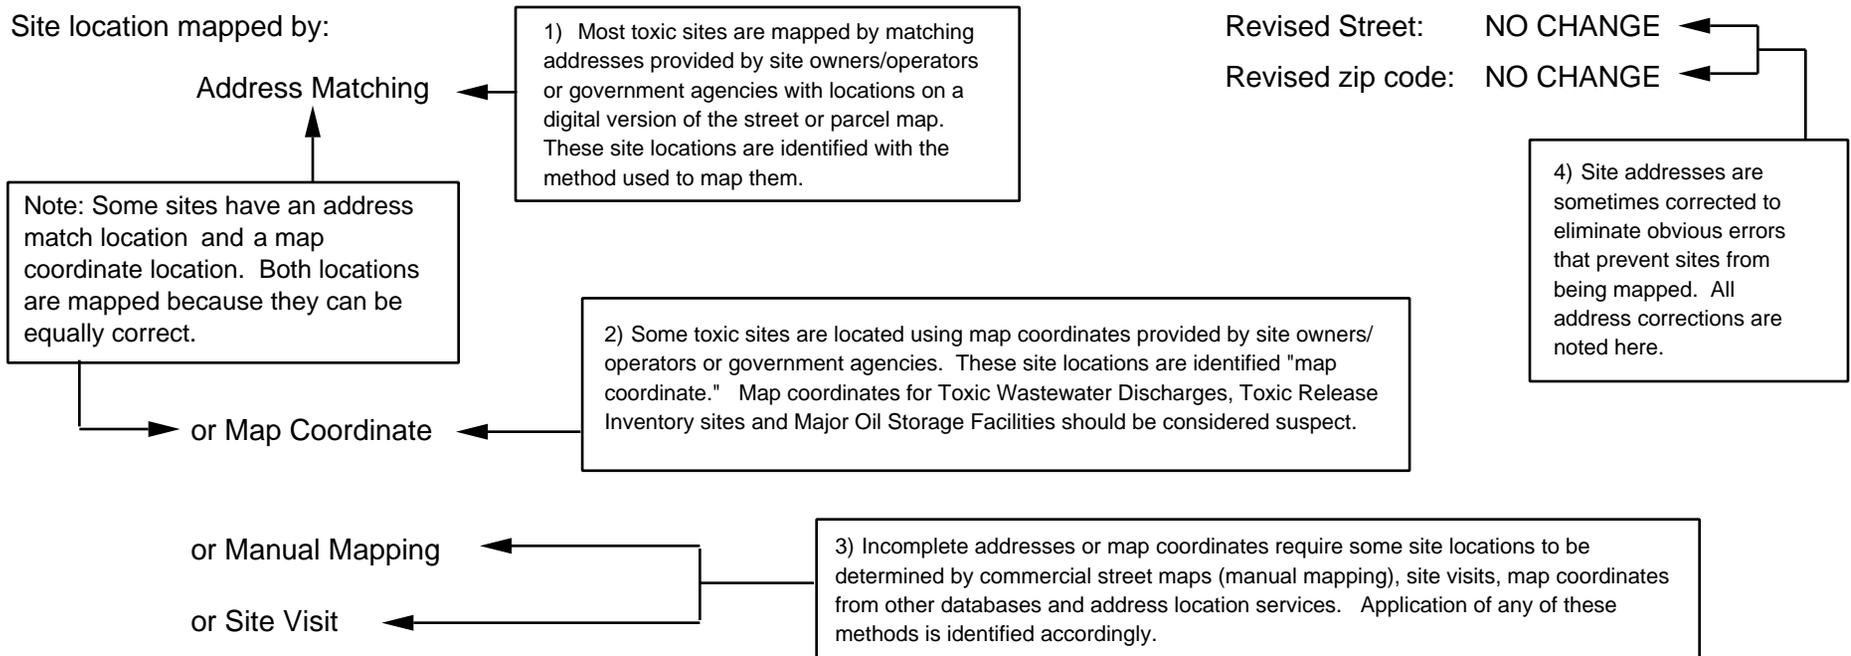

3) Incomplete addresses or map coordinates require some site locations to be determined by commercial street maps (manual mapping), site visits, map coordinates from other databases and address location services. Application of any of these methods is identified accordingly.

ADDRESS CHANGE INFORMATION

Revised Street: NO CHANGE

Revised zip code: NO CHANGE

4) Site addresses are sometimes corrected to eliminate obvious errors that prevent sites from being mapped. All address corrections are noted here.

Information Source Guide

Toxics Targeting's Environmental Reports contain government and other information compiled on 21 categories of reported known or potential toxic sites. Each toxic site database is described below with information detailing a) the source of the information, b) the date when each database is covered to and c) when *Toxics Targeting* obtained the information..

1) **National Priority List for Federal Superfund Cleanup**: Toxic sites nominated for cleanup under the Federal Superfund program. Annual compilation of special two-page detailed profiles of NPL sites. Also includes delisted NPL sites. ASTM required.* Fannie Mae required.** Source: U. S. Environmental Protection Agency.¹
Data attributes updated from: 9/9/2015. Data obtained by Toxics Targeting: 9/9/2015.
New Facilities updated through: 9/9/2015. Data obtained by Toxics Targeting: 9/9/2015.

2) **Inactive Hazardous Waste Disposal Site Registry**: New York State database that maintains information and aids decision making regarding the investigation and cleanup of toxic sites. The Registry's data includes two-page profiles noting site name, ID number, description, classification, cleanup status, types of cleanup, owner information, types and quantities of contaminants, and assessment of health and environmental problems. Also included are sites that qualify for possible inclusion on the Registry. These Registry Qualifying sites may or may not be on the Site Registry. ASTM required.* Fannie Mae required.** Source: New York State Department of Environmental Conservation.²
Data attributes updated through: 7/01/2016. Data obtained by Toxics Targeting: 7/01/2016.
New Facilities updated to: 7/01/2016. Data obtained by Toxics Targeting: 7/01/2016.

3) **Federal & State Corrective Action Activity (CORRACTS)**: New York State and Federal databases of hazardous facilities regulated pursuant to the Resource Conservation and Recovery Act (RCRA).
ASTM required.* Fannie Mae required.**

Re: FOIL Request
Project No.: 12166
200 Central Park West, New York, NY 10024 (American Museum of Natural History)

Dear Sir or Madam:

Pursuant to the Freedom of Information Law, we are requesting information regarding underground/aboveground storage tanks (USTs/ASTs), spill records, remediation sites, dump sites, soil and groundwater remediation, storage/treatment/disposal of hazardous materials or hazardous materials activities for the above referenced site. Your response can either be faxed to (212) 726-0942 or mailed to the address identified above as soon as possible. Please notify me if there are any costs associated with processing this request. In addition, please indicate AKRF's project number (**12166**) on all correspondence. If you have any questions, please call me at (646) 388-9576.

Thank you in advance for your assistance and cooperation.

Sincerely,
AKRF, Inc.

FOIL # 16-08-096
Project # 12166

Dear Ms. Bosco:

This will acknowledge receipt of your request for records under the Freedom of Information Law, received by this office on August 5, 2016.

Your request has been forwarded to the appropriate Department program area(s) to identify documents that are responsive to your request and which may be made available pursuant to all applicable provisions of the Freedom of Information Law.

A determination as to whether your request is granted or denied will be reached in approximately 20 business days or we will notify you in writing if the responsible program area(s) should require additional time to locate, assemble, and review documents that may be responsive to your request.

Please note that, pursuant to Article 6 of the Public Officers Law, a charge may be applied to your request, including the actual cost of the medium used to respond to your Freedom of Information Law request and/or other related costs. When responsive records have been identified, you will be informed of any cost and how payment should be made.

Sincerely,

Re: 200 Central Park West
New York, NY 10024

Dear Ms. Bosco:

This letter responds to your Freedom of Information Law request of August 5, 2016, in which you requested "information regarding underground/aboveground storage tanks (USTs/ASTs), spill records, remediation sites, dump sites, soil and groundwater remediation, storage/treatment/disposal of hazardous materials or hazardous materials activities for the above referenced site." Please be advised that after conducting a diligent search, no records responsive to your request have been located.

The address is served by the New York City public water system, NY7003493. Any violation reports for the public water system can be found here:

http://www.health.ny.gov/environmental/water/drinking/violations/previous_compliance_reports.htm

Should you feel that you have been unlawfully denied access to records, you may appeal such denial in writing within 30 days to the Records Access Appeals Officer, Division of Legal Affairs, Empire State Plaza, 2438 Corning Tower, Albany, New York, 12237-0026.

If you require additional information or wish to discuss this matter further, please do not hesitate to contact me at (518) 474-8734.

Sincerely,

Environmental Site Assessment – Site Questionnaire

Please answer all questions to the best of your actual knowledge. Please call with any questions or comments.

AKRF Contact: Eric Park
Office phone: 800-899-2573
Cell phone: 800-899-2573

Person completing questionnaire: American Museum of Natural History (AMNH) Personnel

Relationship to the site: Coordinated responses from Senior Director of Capital Projects & Construction and Senior Director of Human Resources

Length of time associated with the site: Sr. Dir. Capital Projects & Construction - About 5 years

- 1) When were the current buildings constructed? Do you have surveyed drawings? Blueprints? Geotechnical subsurface studies?

Section 11 – 1927
Section 11B – 1992
Section 15A – 1965
Section 15 – 1903
Section 17 – 1931
Section 7A 1905
Section 7 – 1900

No to all.

- 2) Have there been any renovation or additions since initial construction?

Requires Clarification.

- 3) Is there any historic fill on-site? (Construction and demolition debris? Ash? Dredge spoils?)

Not certain – not aware of any historic fill under any of the buildings.

- 4) Have there been any asbestos or lead assessment or abatement activities at the property? If there is asbestos on-site do you have an operations and maintenance plan?

Yes, we have an asbestos management plan.

- 5) Please describe land use at the property prior to construction of the current buildings.

City property.

- 6) Please describe activities at the site since construction of the current buildings, including previous tenants. Commercial activities such as dry cleaning and auto repair are of particular interest to this study.

AMNH is the first tenant. There is no dry cleaning and auto repair.

- 7) Do you know of specific chemicals that are present or once were present at the property? Yes, we have a full list.

- 8) Do you know of any environmental cleanups that have taken place at the property?

No.

- 9) Do municipal water and sewers service the site, or does it rely on private wells and/or a septic system?

AMNH is on the municipal water and service.

- 10) Are you aware of any wells, public or private, on or near the subject property? Not aware of any in this area.

- 11) Please indicate the nature and frequency of trash removal from the subject property.

Trash is removed from all areas daily. All trash is placed in a 30-yard compactor located in the yard and hauled by a private contractor as needed.

- 12) Are you aware of the current or former use, storage or production of any hazardous materials (petroleum products, solvents, paints, pesticides, etc) in any part of the subject site?

Yes, we have a full list.

- 13) Are any environmental permits or licenses held currently, or in the past, relating to the property?

Yes:

NYSDEC Pesticide Applicator Business Registration Certificate,
NYSDEC Petroleum Bulk Storage Certificate, and
NYSDEC Air Facility Registration Certificate.

- 14) Are there any registrations held for underground or above ground storage tanks at the property (NYSDEC, NYCDOB, FDNY)?

Yes we have registration for NYSDEC and FDNY.

- 15) Have any previous environmental reports, audits or investigations been performed at the site? If available, please provide copies, preferably prior to the site visit.

Yes: NYS onsite inspection for aboveground and underground diesel storage.

- 16) Does the site or any part of the site operate under a community right-to-know plan, safety plan, preparedness and prevention plan, spill prevention, countermeasure or control plan?

Yes to all.

- 17) Does the property have any activity and use limitations (AULs), such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?

NYC Landmarks and Parks

- 18) Are you aware of any reports regarding hydrogeologic or geotechnical conditions on the property or surrounding area?

No

- 19) Please provide copies of any notices or other correspondence from any government agency relating to past or current violations of environmental laws with respect to the property or relating environmental liens encumbering the property.

Attached are correspondence:

NYSDEC – Re: Petroleum Bulk Storage; 05/02/2013, 05/24/2013, & 05/28/2013

EPA – Re: Information request during September 2010 audit

- 20) Please provide copies of any hazardous waste generator notices or reports.

Safety Director has on file.

Requires Clarification.

- 21) Please advise of:

- a. any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on or from the property,

No

- b. any pending, threatened or past administrative proceedings relevant to hazardous substances or petroleum products in, on or from the property; and

None

- c. any notices from any government entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.

Yes – NYSDEC notice, same as #19.

- 22) Have any environmental liens been filed or recorded against the property under federal, tribal, state or local law?

No

- 23) Are you aware of value reduction on the property due to environmental issues?

N/A

24) Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?

N/A

25) Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

No

26) Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?

No

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2013. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 100 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RE: Geophysical Survey
American Museum of Natural History
New York, New York

Dear Mr. Singer:

In this letter, we report the results of a geophysical survey conducted in February, 2017 by Hager-Richter Geoscience, Inc. (H-R) at the American Museum of Natural History (AMNH) in support of an expansion project for the museum by Langan Environmental & Engineering Services, Inc. (Langan). The scope of the project and area of interest were specified by Langan.

INTRODUCTION

Langan was interested in determining the locations of subsurface utilities in the accessible portions of specified areas of interest (AOIs) at the AMNH. The AOIs include a loading dock/employee yard, adjacent park area, and some interior areas of the facility. The designated interior areas were located east of the main yard of the loading dock, in Building 15. Large portions of the interior areas were inaccessible due to storage and collection materials. The only interior areas included in the survey were the X-ray room and the Ichthyology Collections Lab. The areas combined are over 56,000 sq ft in size.

Langan was interested in determining, if possible, the depth and horizontal locations of existing sewer pipes and utility tunnels. The general location of the Site is shown in Figure 1. Figure 2 is a site plan showing the approximate limits of the geophysical survey areas.

OBJECTIVES

The objectives of the geophysical survey were to detect, and if detected, to determine, if possible, the depth and horizontal locations of existing sewer pipes and utility tunnels within the accessible portions of specified AOIs

THE SURVEY

Alexis Martinez and Amanda Fabian of Hager-Richter conducted the field operations on February 6-8, 2017. The project was coordinated with Mr. Samuel Singer of Langan. Mr. Singer specified the AOIs and was present on site at the commencement of the survey.

Photo 1. Main yard of the Loading Dock area.

Photo 2. Looking west into area located south of Building 11.

Photo 3. Park area near 79th Street entrance.

The geophysical survey was conducted using three complementary geophysical methods: time domain electromagnetic induction (EM61), ground penetrating radar (GPR), and precision utility location (PUL). EM61 data were acquired only in the park area located northwest of the loading dock/employee yard but not in the loading dock and interior areas because the reinforced concrete surfaces and walls present therein would interfere with the EM61 data. The EM61 data were acquired at approximately 8-inch intervals along lines spaced 5 feet apart in the accessible portions of the AOI. The EM survey detects and outlines areas containing buried metal. However, the EM method cannot provide information on the type of objects causing EM anomalies.

GPR data were acquired along traverses oriented in two mutually perpendicular directions and spaced no more than 5 feet apart across the accessible portions of the specified AOIs. Large portions of the interior areas were inaccessible. Sparsely located GPR traverses were conducted in a small X-ray room and an Ichthyology Collections Lab where space allowed. The GPR method is useful for detecting both metallic and non-metallic subsurface objects.

Photo 4. X-Ray Room.

Photo 5. Ichthyology Collections Lab.

The PUL method was used to search for subsurface utilities by searching for signals from active electric lines and by tracing utilities from direct connections to nearby surface features

such as valves and conduits. The locations of PUL detected utilities were marked on the ground at the time of the survey and are shown in Plate 1.

EQUIPMENT

EM61. For the EM61 survey, we used a Geonics EM61-MK2 time domain electromagnetic induction metal detector. The EM61 is a time-domain electromagnetic induction type instrument designed specifically for detecting buried metal objects. An air-cored 1-meter by ½-meter transmitter coil generates a pulsed primary magnetic field in the earth, thereby inducing eddy currents in nearby metal objects. The decay of the eddy current produces a secondary magnetic field that is sensed by two receiver coils, one coincident with the transmitter and one positioned 40 cm above the main coil. By measuring the secondary magnetic field after the current in the ground has dissipated but before the current in metal objects has dissipated, the instrument responds only to the secondary magnetic field produced by metal objects. Four channels of secondary response are measured in mV and are recorded on a digital data logger. The system is generally operated by pushing the coils as a wagon with an odometer mounted on the axle to trigger the data logger automatically at approximately 8-inch intervals.

GPR. The GPR survey was conducted using a Geophysical Survey Systems, Inc. UtilityScan HS system using a Hyper Stacking antenna with central frequency of 350 MHz and a 100 ns¹ time window. The system includes a survey wheel that triggers the recording of the data at fixed intervals, thereby increasing the accuracy of the locations of features detected along the survey lines.

GPR uses a high-frequency electromagnetic pulse (referred to herein as “radar signal”) transmitted from a radar antenna to probe the subsurface. The transmitted radar signals are reflected from subsurface interfaces of materials with contrasting electrical properties. The travel times of the radar signal can be converted to *approximate* depth below the surface by correlation with targets of known depths, including stratigraphic horizons, pipes, cables, and other utilities, or by using handbook values of velocities for the materials in the subsurface. The acquisition of GPR data was monitored in the field on a graphic recorder and the real time images were immediately available for field use. The GPR data were also recorded digitally for subsequent processing. Interpretation of the records is based on the nature and intensity of the reflected signals and on the resulting patterns.

PUL. The PUL survey was conducted using a precision electromagnetic pipe and cable locator, Radiodetection RD7000 series. The RD7000 series consists of separate transmitter and receiver. The system can be used in "passive" and "active" modes to locate buried pipes by

¹ ns, abbreviation for nanosecond, 1/1,000,000,000 second. Light and the GPR signal require about 1 ns to travel 1 ft in air. The GPR signal requires about 3.5 ns to travel 1 ft in unsaturated sandy soil.

detecting electromagnetic signals carried by the pipes. In the "passive" mode, only the receiver unit is used to detect signals carried by the pipe from nearby power lines, live signals transmitted along underground power cables, or very low frequency radio signals resulting from long wave radio transmissions that flow along buried conductors. In the "active" mode of operation, the transmitter is used to induce a signal on a target pipe, and the receiver is used to trace the signal along the length of the pipe. Our system uses a 10W transmitter.

LIMITATIONS OF THE METHODS

HAGER-RICHTER GEOSCIENCE, INC. MAKES NO GUARANTEE THAT ALL SUBSURFACE TARGETS OF INTEREST WERE DETECTED IN THIS SURVEY. HAGER-RICHTER GEOSCIENCE, INC. IS NOT RESPONSIBLE FOR DETECTING SUBSURFACE TARGETS THAT NORMALLY CANNOT BE DETECTED BY THE METHODS EMPLOYED OR THAT CANNOT BE DETECTED BECAUSE OF SITE CONDITIONS. GPR SIGNAL PENETRATION MAY NOT BE DEEP ENOUGH TO DETECT SOME TARGETS. HAGER-RICHTER GEOSCIENCE, INC. IS NOT RESPONSIBLE FOR MAINTAINING FIELD MARKOUTS AFTER LEAVING THE WORK AREA. LANGAN UNDERSTANDS THAT MARK-OUTS MADE DURING INCLEMENT WEATHER OR IN AREAS OF HIGH PEDESTRIAN OR VEHICULAR TRAFFIC MAY NOT LAST.

Field mark-outs. Utilities detected by the PUL method at the time of the survey are marked in the field, and the operator makes every attempt, field conditions permitting, to detect and mark as many utilities as possible at the time of survey. Adverse weather and site conditions (rain, snow, snow and soil piles, uneven surfaces, high traffic, etc.) can hamper in-field interpretation. Utility mark-outs made on wet pavement, snow, snow piles, gravel surfaces, or in active construction zones may not last. H-R is not responsible for maintaining utility mark-outs after leaving the work area.

EM61. All electromagnetic geophysical methods, including the EM method used here, are affected by the presence of power lines and surface metal objects (steel sided buildings, dumpsters, vehicles, railroad tracks, reinforced concrete, etc.). Where such are present, the effects of materials in the subsurface may be masked, and firm conclusions about subsurface conditions cannot be made.

Detection and identification should be clearly differentiated. Detection is the recognition of the presence of a metal object, and the electromagnetic method is excellent for such purposes. Identification, on the other hand, is determination of the nature of the causative body (i.e., what is the body -- a cache of drums, UST, automobile, white goods, etc.?). Although the EM61 data cannot be used to *identify* buried metal objects, they provide excellent guides to the identification

of some objects. For example, buried metal utilities produce anomalies with lengths many times their widths.

GPR. There are limitations of the GPR technique as used to detect and/or locate targets such as those of the objectives of this survey: (1) surface conditions, (2) electrical conductivity of the ground, (3) contrast of the electrical properties of the target and the surrounding soil, and (4) spacing of the traverses. Of these restrictions, only the last is controllable by us.

The condition of the ground surface can affect the quality of the GPR data and the depth of penetration of the GPR signal. Sites covered with snow piles, high grass, bushes, landscape structures, debris, obstacles, soil mounds, etc. limit the survey access and the coupling of the GPR antenna with the ground. In many cases, the GPR signal will not penetrate below concrete pavement, especially inside buildings, and a target may not be detectable. The GPR method also commonly does not provide useful data under canopies found at some facilities. GPR surveys inside buildings may be severely constrained by space limitations and interference from above-grade structures.

The electrical conductivity of the ground determines the attenuation of the GPR signals, and thereby limits the maximum depth of exploration. For example, the GPR signal does not penetrate clay-rich soils, and targets buried in clay might not be detected.

A definite contrast in the electrical conductivities of the surrounding ground and the target material is required to obtain a reflection of the GPR signal. If the contrast is too small, possibly due to construction details or deeply corroded metal in the target, then the reflection may be too weak to recognize and the target can be missed. In many cases, plastic, clay, asbestos concrete (transite), brick-lined, stone-lined, and other non-metallic utilities cannot be detected.

Spacing of the traverses is limited by access at many sites, but where flexibility of traverse spacing is possible, the spacing is adjusted to the size of the target. The GPR operator controls the spacing between lines, and the design of the survey is based on the dimensions of the smallest feature of interest. Targets with dimensions smaller than the spacing between GPR survey lines can be missed.

PUL. The PUL equipment cannot detect non-metallic utilities, such as pipes constructed of vitrified clay, transite, plastic, PVC, fiberglass, and unreinforced concrete, when used in passive mode alone. Such pipes can be detected if a wire tracer is installed with access to such tracer for transmission of a signal or where access (such as floor drains and clean-outs) permits insertion of a device on which a signal can be transmitted.

In some, but not all, cases, the subsurface utility designation equipment cannot detect metal utilities reliably under reinforced concrete because the signal couples onto the metal

reinforcing in the concrete. Similarly, the method commonly cannot be used adjacent to grounded metal structures such as chain link fences and metal guardrails.

In congested areas, where several utilities are bundled or located within a short distance, the signal transmitted on one utility can couple onto adjacent utilities, and the accuracy of the location indicated by the instrument decreases.

RESULTS

The geophysical survey was conducted using three complementary geophysical methods: EM61, GPR and PUL. The EM61 survey was limited to the park area to avoid electromagnetic interference from reinforced concrete surfaces and building walls in the loading dock and interior areas. The GPR survey was conducted across the accessible portions of the specified AOIs. The PUL method was also used to track utilities present in the AOIs. Figure 3 is a color contour plot of the results of the EM61 survey, and Plate 1 shows the limits of the EM survey area, locations of the GPR traverses, and the integrated interpretation of the geophysical data.

EM61. The EM61 data were acquired at approximately 8-inch intervals along survey lines spaced 5 feet apart across the accessible portions of the survey area. Interpretation of EM61 data is based on the *relative* response of the instrument in millivolts to local conditions. The instrument is not calibrated to provide an absolute measure of a particular property, such as the conductivity of the soil or the strength of the earth's magnetic field. Subsurface metal objects produce sharply defined positive anomalies when the EM61 is positioned directly over them. Acquiring data at short intervals along closely spaced lines, as was done at the subject site, provides high spatial resolution of the location and footprint of the targets. Thus, buried metal is recognized in contour plots of EM61 data by positive anomalies with spatial dimensions roughly corresponding to the dimensions of the buried metal.

Several moderate to high amplitude EM anomalies are evident for the areas of interest. Some of the EM anomalies are attributed to surface metal objects such as fences, bollards, electric boxes, etc. and such areas are shown as blue hatched areas on Figure 3. We note that the presence or absence of subsurface metal objects in such areas cannot be determined on the basis of the EM data alone because of the anomaly caused by the surface metal objects.

Relatively high amplitude linear EM anomalies are present in the areas surveyed and are attributed to buried possible utilities. The utilities at those locations were confirmed with the GPR and/or PUL methods. Their locations are shown in Plate 1. An up-side-down L-shaped, mid to high amplitude EM anomaly located in the center of the park area is attributed to buried metal. The anomaly is consistent with a subsurface passageway area labeled, "08-LL-11 Shooting Gallery/Storage: Collections Vertebrate Paleontology" shown on the Lower Level Plan provided by Langan, entitled, "160329 Area for Radar Detection - Aperture Plan."

GPR: Apparent GPR signal penetration was variable with two-way travel-time reflections ranging from approximately 10-40 ns in the concrete paved areas and 20 to 40 ns in the grassy areas. Based on velocity matching calibrations made for the areas, the GPR signal penetration is estimated to be approximately 1 - 4 feet. The GPR signal penetration across a reportedly known utility tunnel in a portion of the loading dock area was better than other areas with two-way travel-time reflections ranging from approximately 60-70 ns. . Based on velocity matching calibrations made for the area, the GPR signal penetration is estimated to be approximately 6 - 7 feet.

The locations of the GPR traverses and our interpretation of the data are shown in Plate 1. Most of the utilities detected with the PUL and EM61 methods were also detected with the GPR. Possible electric and other unidentified utility segments were also detected.

The GPR records exhibit linear alignments of reflections attributed to possible utilities or segments of utilities. Two parallel utilities were detected trending northeast across the loading dock beneath the location of a known utility tunnel. The utilities were detected at approximately 7 feet below surface. Review of the GPR records did not reveal any similar utilities which might indicate the location of other utility tunnels.

The GPR records consistent with the location of the L-shaped EM anomaly were reviewed in office. A possible utility was detected along the west edge of the anomaly. No clear records indicating the presence of a subsurface structure or passageway were observed.

Other reflections typical for segments of utilities were detected, and their locations are shown in Plate 1. Whether utilities or other subsurface objects occur at a depth greater than the effective depth of penetration of the GPR signal or in areas inaccessible to the geophysical survey cannot be determined from the GPR data.

PUL. The PUL transmitter was attached to known utilities in exterior portions of the site, (e.g., light poles, electrical boxes and conduits, etc.) and the resultant signal was traced with the receiver. We also conducted a PUL survey in “passive” mode, in the exterior and interior AOIs to detect signals carried by utilities from nearby power lines and telecommunication lines. Several attempts were made to trace utilities from conduits in the loading dock/employee yard area. Reinforcement in the concrete ground surface caused significant interference for the PUL equipment. No utilities were traced in the loading dock area. Where possible, manholes were opened to observe visual alignment of possible utilities. The sections of sewer utilities shown on Plate 1 are based solely on visual alignment from observations in manholes. Several electric lines were marked on the ground with spray paint in the park area and their locations are shown on Plate 1.

CONCLUSIONS

Based on the geophysical survey performed by Hager-Richter Geoscience, Inc. at the American Museum of Natural History, in New York, New York, we conclude that:

- Two possible utilities, consistent with the location of a known utility tunnel, were detected in the loading dock area. However, no other utility tunnel was detected in the surveyed areas.
- Segments of possible electric and sewer utilities were detected in the loading dock area.
- A large buried metal anomaly consistent with a known subsurface structure/passageway was detected in the park area.
- Several electric utilities were detected in the park area.
- Segments of possible utilities were detected in each of the areas.

LIMITATIONS ON THE USE OF THIS REPORT

This letter report was prepared for the exclusive use of Langan Engineering and Environmental Services, Inc. (Client). No other party shall be entitled to rely on this Report or any information, documents, records, data, interpretations, advice or opinions given to Client by Hager-Richter Geoscience, Inc. (Hager-Richter) in the performance of its work. The Report relates solely to the specific project for which Hager-Richter has been retained and shall not be used or relied upon by Client or any third party for any variation or extension of this project, any other project or any other purpose without the express written permission of Hager-Richter. Any unpermitted use by Client or any third party shall be at Client's or such third party's own risk and without any liability to Hager-Richter.

Hager-Richter has used reasonable care, skill, competence and judgment in the performance of its services for this project consistent with professional standards for those providing similar services at the same time, in the same locale, and under like circumstances. Unless otherwise stated, the work performed by Hager-Richter should be understood to be exploratory and interpretational in character and any results, findings or recommendations contained in this Report or resulting from the work proposed may include decisions which are judgmental in nature and not necessarily based solely on pure science or engineering. It should be noted that our conclusions might be modified if subsurface conditions were better delineated with additional subsurface exploration including, but not limited to, test pits, soil borings with collection of soil and water samples, and laboratory testing.

Except as expressly provided in this limitations section, Hager-Richter makes no other representation or warranty of any kind whatsoever, oral or written, expressed or implied; and all implied warranties of merchantability and fitness for a particular purpose, are hereby disclaimed.

If you have any questions or comments on this letter report, please contact us at your convenience. We look forward to working with you again in the future.

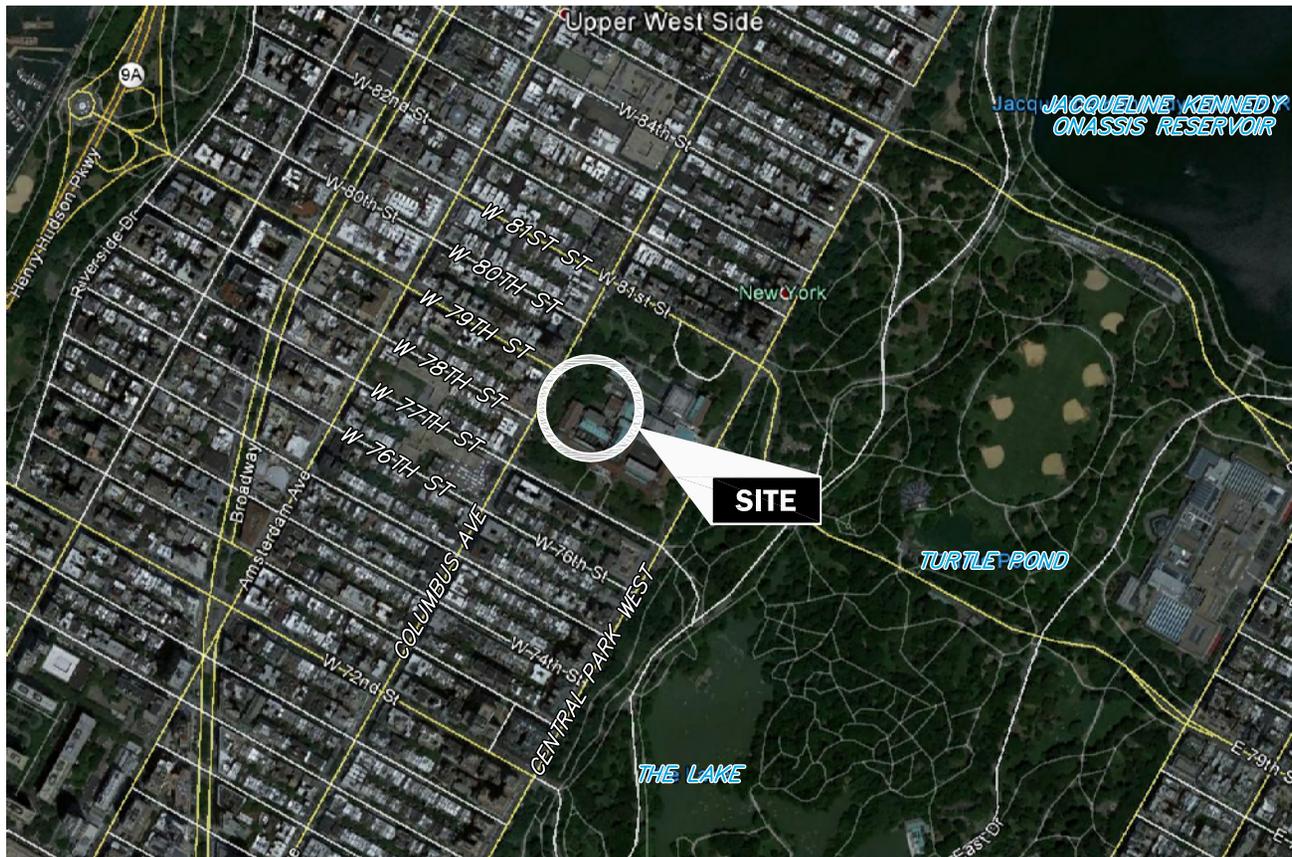

Sincerely yours,
HAGER-RICHTER GEOSCIENCE, INC.

INTRODUCTION

Langan Engineering, Environmental, Survey and Landscape Architecture, D.P.C. (Langan) presents the results of our geotechnical engineering study for the proposed Gilder Center for Science, Education and Innovation (SEIC) development at the American Museum of Natural History in Manhattan, New York. The report summarizes our evaluation of the subsurface conditions and presents our geotechnical recommendations related to foundation design and construction.

Our understanding of the project is based on a review of architectural drawings provided by Davis Brody Bond Architecture, LLP (DBB), the project architect, and structural drawings provided by Arup, the project structural engineer.

Elevations referenced in this report are taken from a topographic survey prepared by Fehringer Surveying, P.C, last revised on 6 March 2017, and are given in reference to the North American Vertical Datum of 1988 (NAVD 88)¹. Elevations referenced in this report were interpolated between points, and should be considered estimated rather than precise.

SITE DESCRIPTION

The project site is on the western side of the American Museum of Natural History (AMNH), which is within Theodore Roosevelt Park. The 17.5-acre park occupies the entire city block bordered by West 81st Street to the north, Columbus Avenue to the west, West 77th Street to the south, and Central Park West to the east (NYC Tax Map Block 1130, Lot 1). The museum is designated as a landmark by the New York City Landmark Preservation Commission (LPC)². Also, the site is within the Central Park West Historic District³. A site location map is presented as Figure 1 below and is attached to this report as Drawing No. 1.

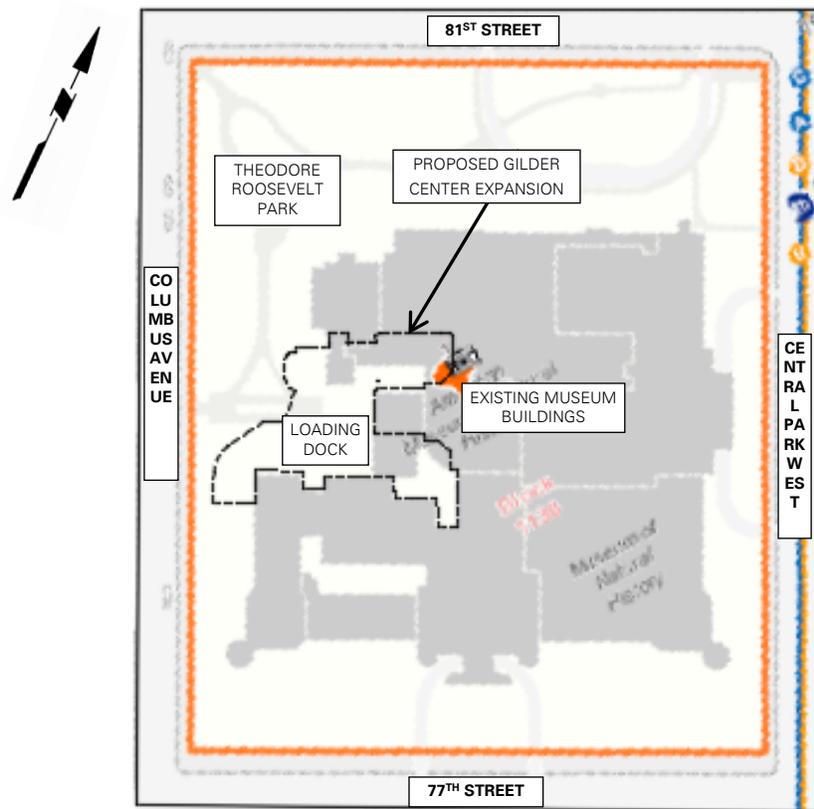

The AMNH complex comprises 26 interconnected buildings (identified as 1 through 13 (including 2A, 2B, 3A, 7A, 11A, and 11B) and 15 through 20 (including 15A)). The buildings were all constructed between 1877 and 2000 and are surrounded by the landscaped park and connecting walkways leading from the sidewalks encircling Theodore Roosevelt Park. Grades along the Columbus Avenue sidewalk fronting Theodore Roosevelt Park are generally about el 86. Topography in the park generally slopes downward toward the museum buildings, with grades between el 81 and 86.

¹ NAVD 88 is 1.1 feet above the U.S. Coast and Geodetic Survey Datum mean sea level at Sandy Hook, New Jersey, 1929, (NGVD).

² Per the NYC Landmarks Preservation Commission Upper West Side/Central Park West Historic District Designation Report, designated 24 April 1990.

³ Per the NYC Landmarks Preservation Commission Report LP-0282, designated 24 August 1967.

Figure 1: Site Location Map

An approximately 20,000-square-foot depressed “loading dock” is west of Buildings 1, 7, 7A, 15, and 15A, north of Buildings 8, 11, and 11B, and south of Buildings 16 and 17. The loading dock is about 13 to 16 feet below park grade, corresponding to about el 65 to 69, and separated from the park by a concrete retaining wall. AMNH buildings adjacent to the loading dock have cellars accessible to the loading dock. Utilities and utility trenches run beneath the loading dock slab and connect mechanical, electrical, and plumbing services between museum buildings and from Columbus Avenue.

West of Building 8, a vehicle ramp provides access from the intersection of Columbus Avenue and West 79th Street to the loading dock. The ramp is separated from the park by a stone gravity retaining wall. An elevated landscaped area between Building 8 and the vehicle ramp is supported by a concrete retaining wall.

Site History

A review of historical records and maps indicates that Theodore Roosevelt Park was initially mapped as park land in 1807 and later developed into Manhattan Square by the City of New York circa 1839. A review of the historic “Topographical Map of the City and County of New York” (Colton, 1836) and “Sanitary & Topographical Map of the City and Island of New York” (Viele, 1865) indicates that the site was previously marsh and meadow. The meadow grade tapered downward toward marsh to the western part of the

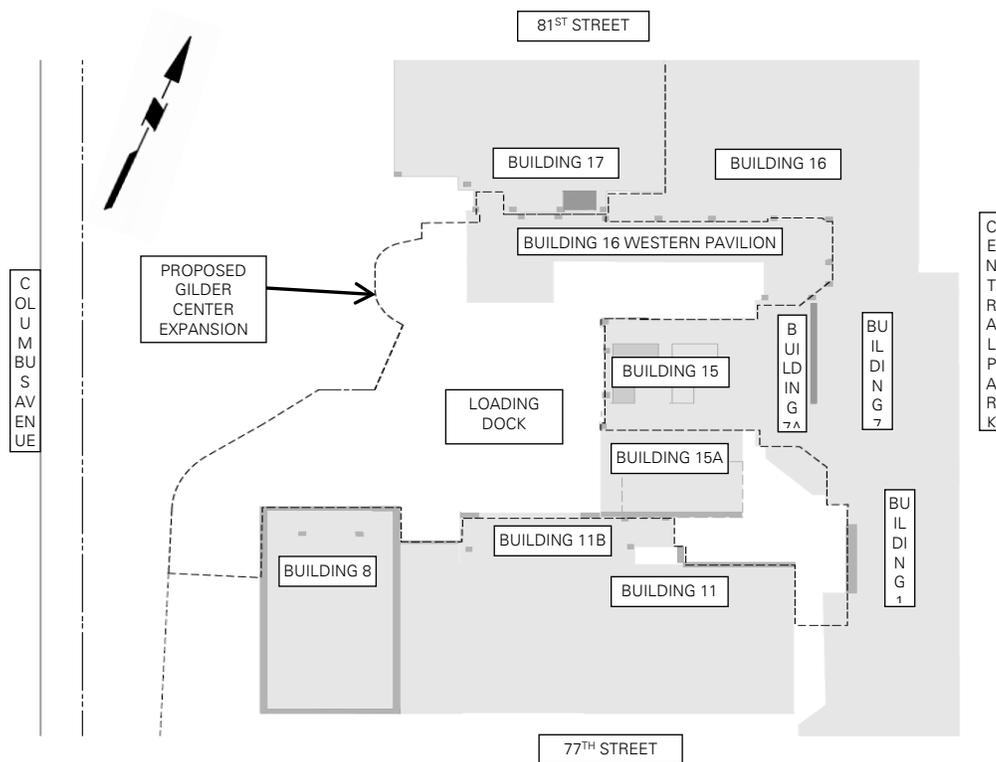

loading dock footprint. Relevant parts of the Colton Map and Viele Map are presented as Drawings Nos. 2 and 3, respectively.

The first museum buildings were constructed on Manhattan Square in the 1870s. Expansion of the museum continued through the late 19th century and into the 20th with additional buildings that connect to the initial museum. Manhattan Square was renamed Theodore Roosevelt Park in 1958.

Structures Adjacent to the Proposed Development

As discussed here, several AMNH buildings surround the project site. We have included a site plan as Figure 2, showing the buildings that are adjacent to or within the proposed Gilder Center footprint.

Figure 2: Site Plan

These are descriptions of the adjacent buildings:

- Building 1 (east of the proposed development), constructed circa 1877, is six-stories with one cellar at about el 67, with access to the loading dock.
- Building 7 (east of the proposed development), built circa 1908, is six-stories with one cellar between about el 61 and 68. An exterior stair tower connects to the southwest corner of this building.
- Building 7A (within the eastern portion of the proposed development), built circa 1908, is two -stories with one cellar (at about el 68) connecting to Buildings 7 and 15. The

cellar serves as mechanical space

- Building 8 (south of the proposed development), built circa 1900, is six-stories with one cellar from about el 66 to 68 with access to the loading dock. An enclosed fire stair was constructed circa 1970 to the exterior of the northeast corner of this building, and a vehicle ramp from Columbus Avenue curves under an overhang at the north end of the building.

A tunnel (that was a former rifle range) with an L-shaped footprint below the park extends about 110 feet from the north end of the Building 8 overhang. The tunnel floor is at about el 70 with access to the loading dock.

- Building 11 (south of the proposed development), built circa 1929, is six-stories with one cellar (at about el 67.5 to 68.5) with access to the loading dock.
- Building 11B (south of the proposed development), built circa 1991, is six-stories and is supported by columns that extend down to the loading dock at about el 67.5 to 68.5.
- Buildings 15 and 15A (within the eastern part of the proposed development), built circa 1931, is two-stories with one cellar, which serves as a boiler room and mechanical space (at about el 64 to 68) with access to the loading dock.
- Building 16 (north and east of the proposed development), built circa 1997, is two-stories with one cellar (at about el 63 to 68) with access to the loading dock.

An expansion of Building 16 was constructed circa 1997 to the west of Building 16 and south of Building 17. The expansion is two-stories and is supported by columns that extend down to the loading dock. The loading dock grade beneath the expansion is at about el 65 to 68.

A one-story glass pavilion with one cellar is at the western end of the expansion. The first floor of the pavilion is at about el 83 and has access to the park. A sprinkler and plumbing utility room occupies the cellar at about el 65 with access to the loading dock.

- Building 17 (north of the proposed development), built circa 1928, is six-stories with one cellar (at about el 65 to 68), with access to the loading dock. A service elevator pit at the southern perimeter of the building is at about el 62.

PROPOSED CONSTRUCTION

The proposed Gilder Center will be a five-story building with one cellar (below the existing park grade). The approximate 49,000-square-foot footprint is proposed in the park west of the existing loading dock and will include new columns inside Buildings 7A and 15. The proposed top of the cellar slab elevation is planned to be about el 64.5; with a general subgrade about 2 feet lower (about el 62.5). We understand that various pits within the structure may extend as deep as 15 feet below the cellar slab (e.g., mechanical, elevator, detention pits, etc.).

These are the proposed construction activities:

- Partially demolish Buildings 7A and 15 down to the first floor;
- Demolish Building 15A;
- Demolish the stair tower adjacent to the west of Building 7;
- Demolish the Building 16 western expansion;
- Demolish the concrete retaining walls that separate the park and loading dock;
- Construct the Gilder Center;
- Re-grade the ramp from Columbus Avenue to the new cellar, including new adjacent landscaping;
- Construct a new retaining wall at the lower portion of the vehicular ramp that connects the existing stone retaining wall to the new foundation wall;
- Relocate utilities; and
- Re-grade and landscape in the park to the west of the proposed Gilder Center.

Proposed typical column loads were reported by Arup to be between about 140 and 3,500 kips.

SUBSURFACE EXPLORATION

The subsurface exploration program for the proposed development consisted of drilling nine borings, installing three groundwater observation wells, and excavating 19 test pits. The Subsurface Exploration Plan is presented as Drawing No. 5.

Borings

The borings (LB-1 through LB-7, SLB-1, and SLB-2) were completed by Aquifer Drilling and Testing, Inc. (ADT) from 2 February through 1 March 2017 under the full-time special inspection of Langan. Borings LB-5, LB-6, and LB-7 were drilled from the loading dock grade to about 21 to 35 feet below top of slab. The remaining borings (LB-1 through LB-4) were drilled within the park, west of the loading dock, to about 36 to 60 feet below park grade. Borings SLB-1 and SLB-2 were located about 20 to 30 feet east of the Theodore Roosevelt Park western property line for the proposed stormwater detention tank; the two borings were drilled to about 12 to 18 feet below park grade.

All borings were advanced through soil using mud-rotary drilling techniques and a tri-cone roller bit. Drilling fluid and steel casing were used to provide support for the sidewalls of the borehole during drilling. Standard Penetration Tests (SPT)⁴ N-values were measured and soil samples were obtained continuously through the top 12 feet and at 5-foot intervals thereafter. Soil samples were retrieved using a 2-inch-diameter standard split-spoon sampler driven by a 140-pound steel donut hammer in accordance with ASTM D1586.

⁴ The Standard Penetration Test is a measure of the soil density and consistency. The SPT N-value is defined as the number of blows required to drive a 2-inch outside diameter split-barrel sampler 12-inches, after an initial penetration of 6 inches, using a 140 lb hammer falling freely from a height of 30 inches.

A minimum of 10 feet of rock was cored in Borings LB-1 through LB-7, using an NQ-sized double-tube core barrel. The core barrel was equipped with a diamond cutting bit, in accordance with ASTM D2113. Rock Recoveries (REC)⁵ and Rock Quality Designations (RQD)⁶ were determined for each core run.

Recovered soil samples were visually examined and classified in the field by our engineer, in accordance with the Unified Soil Classification System (USCS) and the city Building Code. All soil samples and rock cores were returned to our New York City office for confirmation of field classifications. Soil and rock classifications, N-values, and other field observations were recorded on the boring logs, which are presented in Appendix A.

Observation Wells

Three groundwater observation wells were installed in completed boreholes LB-1, LB-4, and LB-7. Each well consisted of 10 feet of 2-inch-diameter Schedule 40 PVC slotted pipe (screen) and 10 to 50 feet of solid riser pipe. The annulus around the pipe was backfilled with silica sand to about 2 feet above the screen, sealed with a 1- to 2-foot-thick layer of bentonite pellets, backfilled with soil cuttings, and sealed with 1 foot of grout at grade to prevent surface water from influencing the well readings. A protective flush-mounted steel well cap was installed flush with the adjacent ground surface. Observation well construction logs are provided in Appendix A.

Test Pits

Fourteen test pits (TP-1 through TP-14) were excavated within the proposed Gilder Center footprint adjacent to existing AMNH buildings. The purposes of the test pits were to document the configuration of the existing footings and bearing materials bordering the new building. ADT hand-excavated the test pits from 31 January through 10 March 2017 under the full-time special inspection of Langan. The test pits were excavated to about 3 to 12 feet below grade.

Five additional test pits (LTP-1 through LTP-5) were hand-excavated up to 3 feet deep in the park. The purpose of Test Pits LTP-1 through LTP-5 was for Reed Hilderbrand (the project landscape architect) to document properties of the surficial soils. A representative from Reed Hilderbrand was at the site to observe the test pits on 6 and 7 March 2017. We understand that the findings from these test pits will be documented by Reed Hilderbrand.

Observed conditions in the building test pits were documented by Langan using sketches and photographs. Representative soil samples were collected from the test pits and classified in accordance with USCS and the Building Code. Upon completion of sampling, the test pits were backfilled and compacted in lifts and patched with concrete and

⁵ The recovery is the percentage of the length of the recovered core to the total length of the core run.

⁶ The Rock Quality Designation is a modified core recovery percentage in which all pieces of sound core over 4 inches are counted as recovery.

reinforcement to match the adjacent existing slab. Sketches, representative photographs, and descriptions of each test pit are provided in Appendix B.

Laboratory Testing

Geotechnical laboratory tests were conducted on representative soil and rock samples to verify soil classifications and to determine engineering characteristics of the soil and rock for use in our geotechnical evaluation and design. The following geotechnical laboratory tests were performed:

- Soil Classification (ASTM D2487)
- Sieve and Hydrometer Analysis (ASTM D422)
- Water Content (ASTM D2216)
- Liquid and Plastic (Atterberg) Limits (ASTM D4318)
- Uniaxial Compressive Strength of Rock (ASTM D7012C)
- Electrical Resistivity of Soil (ASTM G57).

The laboratory test results are presented in Appendix C.

SUBSURFACE CONDITIONS

The generalized subsurface soil profile consists of a layer of uncontrolled fill underlain by varying amounts of clay and sand down to bedrock. A layer of decomposed rock was encountered above the sound bedrock at the site. A description of each stratum is given below in order of increasing depth. Representative subsurface profiles are presented as Drawings Nos. 6, 7, and 8.

Uncontrolled Fill [Class 7]

A layer of uncontrolled fill, consisting generally of brown medium to fine sand with varying amounts of silt, gravel, rock fragments, and debris (e.g., concrete, brick, masonry) was encountered from about 6 to 21 feet below park grade and 3 to 7 feet below loading dock grade, corresponding to about el 60 to 79. SPT N-values in the fill were from 8 blows per foot (bpf) to spoon refusal (greater than 100 blows per 6 inches of spilt-spoon sampler penetration), averaging about 20 bpf. The large range in N-values is likely due to the variable nature of the uncontrolled fill and the presence of obstructions such as gravel, rock fragments and debris impeding advancement of the split-spoon sampler.

Moisture content in the fill was from 19 to 27%, and averaged about 23%. Electrical resistivity averaged about 3,800 ohm-cm and electrical conductivity averaged about 0.00026 ohm-cm⁻¹.

The fill is loose material classified as Building Code Class 7, Controlled and Uncontrolled Fills.

Sand [Class 3a and 3b]

A layer of brown medium to fine sand with various amounts of silt, clay, and trace gravel was encountered below the fill where rock was not encountered directly below the fill in Borings LB-1 through LB-6. The top of the sand was encountered between el 58 and 62. The sand layer is between about 2 and 25 feet thick. N-values within the layer were from 14 to over 100 bpf generally increasing with depth, and averaging about 35 bpf. Cobbles and boulders were encountered throughout the layer. Moisture content was from 19 to 26%, and averaged about 23%. Electrical resistivity averaged about 1,150 ohm-cm and electrical conductivity averaged about 0.00088 ohm-cm⁻¹.

The sand layer was given USCS classifications of SM (silty sand), SP (poorly graded sand), and SW (well-graded sand). The sand is generally classified as Building Code Class 3b, Medium-Dense Granular Soils and Building Code Class 3a, Dense Granular Soils.

One- to 3-foot-thick lenses of gray clay with trace amounts of silt and sand were encountered in the upper parts of the sand layer in Borings LB-1 through LB-6. N-values within the clay generally were from 11 to 27 bpf, and averaged about 18 bpf. Liquid Limits (LL) was from 27 to 35%, and averaged about 31%; Plastic Limits (PL) were from 18 to 20%, and averaged about 19%; and Plasticity Indexes (PI) were from 9 to 15, and averaged about 12.

The clay lenses were given a USCS classification of CL (clay). The clay is generally classified as Building Code Class 4b. An N-value of 3 bpf was recorded in the clay in Boring LB-6, indicative of soft clay, which is classified as Building Code Class 6.

Decomposed Rock [Class 1d]

A 2- to 14-foot-thick layer of decomposed rock was encountered below the fill layer or sand layer (where encountered) on top of competent bedrock. The decomposed rock is typically characterized as gray coarse- to fine-grained, highly fractured, and highly weathered mica schist. The top of the decomposed rock at the proposed Gilder Center footprint was encountered at about 20 to 48 feet below park grade and 2 to 30 feet below loading dock grade, corresponding to about el 35 to 64. The top of the decomposed rock at the proposed stormwater detention basin was encountered at about 7 to 10 feet below park grade, corresponding to about el 75 to 79. Within the mid-western portion of the site, several borings encountered the top of decomposed rock (and sound bedrock) at a deeper elevation (compared to the eastern portion) indicative of a "valley" of rock within a portion of the park. N-values within the layer are generally over 100 bpf. Rock core recoveries (REC) varied between 10 and 43%. The corresponding rock quality designations (RQD) varied between 0 and 20%. The decomposed rock is classified as Building Code Class 1d, Soft Rock.

Bedrock [Class 1a, 1b, and 1c]

The competent bedrock, encountered below the decomposed rock, is typically characterized as gray medium- to fine-grained mica schist with quartz intrusions. The bedrock was generally slightly to moderately fractured and fresh to moderately weathered. The top of competent bedrock at the proposed Gilder Center footprint typically was about 20 to 50 feet below park grade and 3 to 30 feet below loading dock grade, corresponding to about el 31 to 64. As discussed herein, within the mid-western portion of the site, several borings encountered the top of decomposed rock and sound bedrock at a deeper elevation (compared to the eastern portion) indicative of a “valley” of rock within a portion of the park. The top of bedrock at the proposed stormwater detention basin was encountered at about 12 to 18 feet below park grade, corresponding to about el 68 to 73.

Rock core recovery varied between 93 and 100%, averaging about 98%. The corresponding RQD varied between 70 and 100%, averaging about 88%. Uniaxial compressive strength values from lab tests averaged about 12,000 psi.

The bedrock is classified as Building Code Class 1a, 1b, and 1c – Hard Rock, Medium-Hardness Rock, and Intermediate-Hardness Rock, respectively. Part of the USGS bedrock geology information map prepared by Charles A. Baskerville is provided as Drawing No. 4 for reference.

Groundwater

Groundwater measurements were recorded in three observation wells and test pits during our subsurface exploration. Water was measured to be about 4 to 10 feet below loading dock grade, corresponding to about el 57 to 64 – near the top of the rock or the clay where clay was encountered. The measured water depths are indicative that groundwater is likely perched near the top of rock or clay.

Test Pit Findings

Table No. 1 summarizes the test pits findings at each building and structure. Test-pit sketches, photographs, and detailed descriptions are provided in Appendix B.

Table No. 1: Test Pit Findings Summary

| Test Pit | Location | Foundation Type | Foundation Bearing Material | Bottom of Foundation (Depth) [Elevation] |
|-----------------|--|---|------------------------------------|---|
| TP-1A | <i>Building 17</i> South of south wall, adjacent to the elevator pit; and at a column for the <i>Building 16 overhang</i> | <i>Building 17:</i> Concrete Footing beneath the elevator pit <i>Building 16 Column:</i> Concrete Spread Footing | Competent Rock | Building 16: (6) [60] Building 17: (10.5) [55.5] |

SEISMIC EVALUATION

This section presents the results of our seismic evaluation relative to the general procedures outlined in the Building Code. We have assigned the proposed structure to have a Structural Occupancy Category III. Table No. 2 provides our recommended parameters for use in seismic design of the proposed building.

Table No. 2 - Building Code Seismic Design Parameters

| Seismic Design Parameter | Recommended Value | 2014 NYCBC Reference |
|---|-------------------|------------------------------------|
| Mapped Spectral Acceleration for short periods (S_s) | 0.281 g | Section 1613.5.1 |
| Mapped Spectral Acceleration for 1-second period (S_1) | 0.073 g | |
| Site Class | C | Table 1613.5.2 |
| Site Coefficient for short periods (F_a) | 1.2 | Tables 1613.5.3(1) and 1613.5.3(2) |
| Site Coefficient for 1-second period (F_v) | 1.7 | |
| Design spectral response acceleration at short periods (S_{DS}) | 0.225 g | Section 1613.5.4 |
| Design spectral response acceleration at 1-sec period (S_{D1}) | 0.083 g | |
| Seismic Design Category | B | Section 1613.5.6 |

Liquefaction Potential

The Building Code requires an evaluation of the liquefaction potential for noncohesive soils below the groundwater table and to a depth of 50 feet below the ground surface. In accordance with the Building Code screening process for liquefaction, SPT N-values are plotted versus depth on the Liquefaction Assessment Diagram. The plotted data points are classified as either "Liquefaction evaluation required" or "Liquefaction evaluation not required," based on whether the points plot to the left or right side, respectively, of the Structural Risk/Occupancy Category line for the proposed building. About half of the points above a depth of 10 feet plot to the left of the Structural Risk/Occupancy Category III line, "Liquefaction evaluation required." This plot is provided as Drawing No. 9.

The potential for soil liquefaction was further evaluated using the procedure outlined by Youd et al. (2001). The Youd et al. evaluation is considered to be the "State of Practice" procedure as recommended by the National Earthquake Hazard Reduction Program (NEHRP). This evaluation presents an empirical relationship between the earthquake demand, represented by the Cyclic Stress Ratio (CSR), and the soil's resistance to dynamic loading, represented by the Cyclic Resistance Ratio (CRR). The CSR is correlated to the Peak Ground Acceleration (PGA) of the design earthquake event and in situ stresses. The CRR is correlated to SPT N-values, and adjusted for soil overburden pressure, hammer energy efficiency, and percent of silts and clays.

The potential for soil liquefaction was evaluated using an earthquake event of magnitude 5.71, a PGA of 0.20g, and a Magnitude Scaling Factor of 2.25. Based on the Youd et al. evaluation, all of the points have a factor of safety greater than one. It is our judgment that liquefaction is unlikely and will not impact the foundation design. A plot of the factor of safety with depth using the Youd et al. (2001) procedure is provided as Drawing No. 10.

FOUNDATIONS DESIGN AND RECOMMENDATIONS

The following sections present our recommendations for design and construction of the foundation system, slab support, below-grade walls, groundwater control, and retaining walls.

Foundation Evaluation and Design

Depth to competent bedrock is noted to be highly variable throughout the proposed Gilder Center footprint. A majority of the existing surrounding buildings are founded on bedrock; however the rock was deeper in a majority of the open-air courtyard. In summary, the top of bedrock was encountered at about the proposed cellar level in the southwestern and southeastern parts of the proposed footprint, up to 10 feet below the proposed cellar in the northern part of the proposed footprint; and about 30 feet or greater below the proposed cellar in the mid-western part of the proposed footprint.

Because of the variability of the depth to rock and the thicknesses in soil layers we have evaluated several foundation options. We anticipate that the final foundation selections will likely be a combination of foundation types. We evaluated the following foundation options:

1. *Shallow Foundations* -
 - a. Bearing on competent/decomposed rock (where rock is shallow):
 - b. Bearing within the sand layer (per discussions with Arup, potentially feasible for loads less than 250 tons);
 - c. Mat slab foundation bearing within the sand layer; and
2. *Deep Foundations* - caissons socketed into competent rock (where rock is deep)

Multiple foundation elements on varying bearing materials will settle and deflect differently. Typically, the greater the differential settlements, the greater the adverse effects on the structure. For example, settlements of shallow foundations bearing on sand are a result of elastic compression of the sand strata, while caissons deflect only when fully loaded. Estimated settlements for the shallow foundations are largely dependent on the footing and/or mat foundation size and depth.

Based on the proposed loading reported by Arup, differential settlements of adjacent foundation elements bearing on dissimilar materials (i.e. rock and sand) is estimated to be up to about 1-inch⁷. However, estimated differential settlements decrease to less than about ½-inch if all foundation elements are bearing-on or socketed into either decomposed or competent bedrock. Recommendations and evaluation for each foundation type listed above are discussed below.

⁷ We note that this estimated differential settlement is based on the assumption of a foundation bearing on bedrock (footing or piles) and compared to a shallow foundation load of less than 250 tons bearing on the natural sand layer; and spaced about 25 feet apart.

Shallow Foundations

When bedrock is within 10 feet from the proposed cellar slab level, the recommended foundation support is footings and/or piers bearing on competent bedrock. The recommended allowable bearing capacity for foundations bearing on competent rock is up to 20 tons per square foot (tsf). Based on the proposed individual column loading, estimated settlements are expected to be less than ¼-inch.

Alternatively, as discussed herein, we have also reviewed the proposed loading if a shallow foundation was to bear on the sand or decomposed rock layer. The recommended bearing capacity for shallow foundations bearing on the decomposed rock layer is 8 tsf. We note that in some cases at the site, sound bedrock may be 2 to 5 feet deeper; therefore local excavation through the decomposed rock down to the sound bedrock would offer a higher bearing capacity and less differential settlement. Based on the proposed column loads, estimated settlements of shallow foundations bearing on decomposed rock are anticipated to be on the order of less than ½-inch.

For lightly loaded columns (loads less than 250 tons) where the project team considers excavation to top of decomposed or competent rock not feasible, shallow foundations could bear on the medium-dense to dense sand layer. The recommended allowable bearing capacity for the natural sand layer is up to 4 tsf. Estimated settlements for footings (with loads of less than 250 tons) bearing on sand are anticipated to be on the order of 1-inch. For shallow foundations bearing in sand with loads greater than 250 tons, we would expect much higher settlements.

Bearing areas of shallow foundations may need to be expanded as a mat foundation that encompasses multiple columns to limit settlement to levels determined acceptable by Arup. A preliminary modulus of subgrade reaction of 90 psi/inch may be used for design of a mat foundation bearing in the sand. Once the foundation loading and column layouts have been finalized, we recommend that Langan review the loading and advise on whether revisions to the subgrade modulus value are warranted.

Footings and piers should have a minimum bearing area of 9-square-feet and a minimum width of 2 feet. Where adjacent footings are constructed at different depths, the higher footing should be constructed no higher than a line drawn at 2-feet offset from the edge of the footing at a slope of 1.5-horizontal to 1-vertical from 2-feet offset from the bottom of the lower footing to minimize risk of loading the footing. Where a proposed footing is adjacent to an existing footing bearing on rock, the bottom of the proposed footing should not be higher than the bottom of the existing adjacent footing. The influence zone for new footings with respect to adjacent footings in soil is shown on Drawing No. 11.

The Building Code requires that a Professional Engineer licensed in the state of New York inspect and approve foundation subgrades before placing concrete, to verify that the subgrade material is adequate to provide the recommended allowable bearing pressure. Footing subgrades should be prepared as described in the "Subgrade Preparation" section within this report.

Deep Foundations

A deep foundation element, such as a drilled caisson, is a feasible foundation option where the project team considers bedrock is too deep to construct piers to bedrock. A drilled caisson is a deep foundation element that consists of an open-ended steel casing section drilled a minimum of one-foot into competent bedrock. A rock socket is then drilled into the competent bedrock. The structural load is transferred to the bedrock through the rock socket. Once the required rock socket depth is achieved, the rock socket is visually inspected, and the inside of the caisson is filled with cement grout and steel reinforcement.

The Building Code requires that a Professional Engineer licensed in the state of New York visually inspect each rock socket to verify rock quality and approve the installation of each caisson. Load tests may be substituted for inspection of rock sockets; however, we recommend visual inspection of the rock sockets to verify rock quality.

Table No. 3 presents caisson types for a range of axial capacities. Estimated deflections of the proposed caisson options provided in Table 2 are up to about ½-inch. Other caisson configurations may be feasible to provide the desired capacity. The design uplift and lateral capacity for the caissons should be evaluated once the foundation loads and caisson layout are finalized to account for group impacts.

Table No. 3: Caisson Options

| Socket Diameter (inches) | Estimated Design Capacity (tons) | | |
|--------------------------|-----------------------------------|----------------------|----------------------|
| | Minimum Rock Socket Length (feet) | | |
| | 5 | 10 | 15 |
| 8 | 150 (2-#18 Bar) | 240 (2-#24 Bars) | * |
| 11 | 200 (2-#18 Bar) | 350 (3-#20 Bars) | 450 (4-#24 Bars) |
| 12 | 225 (1-#28 Bar) | 400 (3-#24 Bars) | 500 (4-#24 Bars) |
| 16 | 300 (1-#28 Bar) | 600 (6-#20 Bar) | 750 (6-#24 Bar) |
| 22 | 400 (1-#20 Bar) | 800 (6-#18 Bar) | 1,250 (6-#28 Bar) |
| 28 | 500 (1-#18 Bar) | 1,000 (2-#24 Bar) | 1,500 (6-#28 Bar) |

* The structural capacity limits the capacity of the mini-caisson.

All caisson options listed in Table No. 3 require the use of Grade 50 casing with minimum ½-inch thick walls, cement grout having a 28-day compressive strength of at least 6,000 psi, and Grade 75 thread bar reinforcing steel. Centralizers must be used to keep the

thread bar reinforcing centered in the casing and rock socket. Minimum center-to-center spacing between caissons should be no closer than 2.5 times the casing diameter.

Permanent Tie-Down Anchors

Depending on the final building layout and gravity loading, uplift/tension forces may need to be resolved for the building. Post-tensioned tie-down anchors socketed into bedrock can resist uplift/tension forces, if needed. We recommend double-corrosion-protected, Grade 150 steel threaded bars meeting ASTM A722 requirements for high-strength reinforcement steel.

The free-stressing (unbonded) length should be at least 10 feet long. The free-stressing length of bar should be proportioned such that the dead weight plus the tensile strength of the engaged rock mass is greater than the individual anchor load or the sum of the group anchor loads. Table No. 4 presents the estimated design capacity for three anchor diameter sizes of varying bond lengths. If additional capacity for the anchors is required, revised anchor designs can be provided to the structural engineer during the design phase. **Table No. 4: Recommended Tie-down Design Summary**

| Anchor Hole Diameter (inches) | 150 ksi Steel Thread Bar Diameter (inches) | Structural Capacity (tons) | Bond Length Required (feet) |
|--------------------------------------|---|-----------------------------------|------------------------------------|
| 6 | 1.75 | 100 | 10 |
| 6 | 2.25 | 150 | 15 |
| 7.5 | 2.5 | 200 | 15 |

We recommend that a minimum of 10% of the tie-down anchors be performance-tested to 133% of their design load. All remaining anchors should be proof-tested to 133% of their design load. Successfully tested anchors should be locked off at a load matching or exceeding the sum of the design load, seating loss, and long-term losses. All anchors should be tested and locked-off in accordance with the Post-Tensioning Institute's "Recommendations for Prestressed Rock and Soil Anchors" (2014).

Groundwater Design

The highest measured water level (about el 64) is within one-foot of the proposed cellar. We noted the presence of water in a majority of the test pits excavated at the site. The water is likely perched on top of the rock and clay. Perched water will typically flow towards the lowest elevation of impervious material (rock or clay), and could build up behind below-grade walls if trapped between the walls and the imperious layer. Groundwater is also expected to fluctuate with events such as high precipitation, seasonal variations, construction activity, and/or groundwater pumping. We recommend that the design groundwater level be taken at 3 feet above the highest measured groundwater level, or at about el 67, or about 2 feet above the proposed cellar slab level.

Slab Support

Considering that the cellar slab and various pits will be below the design groundwater table, we recommend that the lowest-level slabs are designed as either a structural slab to resist hydrostatic pressure or as a slab-on-grade with an underslab drainage system. A structural slab would be designed to span between footings, caps and/or, tie-down anchors. If the lowest level slab is designed as a slab-on-grade, an underslab drainage system would be required, as recommended below.

Permanent Below-Grade Walls

Permanent below-grade walls should be designed to resist lateral pressures due to soil and rock loads, groundwater (hydrostatic) loads, and surcharge loads. Dynamic lateral loads need not be considered in accordance with the seismic design requirements for building in Seismic Design Category B.

The recommended design lateral pressures above the groundwater table have a triangular distribution using an equivalent fluid weight of 55 pounds per square foot (psf) per foot of depth of soil. The lateral earth pressures below the groundwater table have a triangular distribution of 25 psf per foot of depth in addition to 63 psf per foot of depth. Lateral rock pressures have a triangular distribution of 18 psf per foot of depth. Surcharge loads (i.e., vehicular, sidewalk, etc.) should be considered in the design of below-grade walls. Lateral pressures caused by a surcharge load have a uniform rectangular distribution of about 50-percent of the vertical surcharge pressure. Our recommended lateral earth-pressure diagram is provided as Drawing No. 12.

Backfill should not be placed against below-grade walls until the concrete has reached its 28-day compressive design strength and after either the first floor slab has been completed, or temporary lateral bracing has been provided to prevent rotation of the wall. Additionally, no backfill should be placed against foundation walls unless approved by the owner's structural engineer.

Permanent Groundwater Control

Given the proposed use of the below-grade space, we recommend that all of the below-grade slabs and walls be fully waterproofed with a membrane-type waterproofing. Possible options for permanent control of groundwater can be accomplished by:

1. Designing the cellar slab and below-grade walls to resist hydrostatic forces resulting from water at the recommended design water level of el 67;
2. Designing the below-grade walls to resist hydrostatic pressures from water at el 67 and providing an underslab drainage system to relieve the hydrostatic pressures under the slab; or
3. Providing a cellar wall drainage system and underslab drainage system to relieve the hydrostatic pressures.

It should be noted that discharging the collected water from a drainage system into the storm sewer system could require the New York City Department of Environmental Protection (NYC DEP) review. We estimate that the pumping rate from the underslab drainage would be a fraction of the proposed project discharge flow to the sewer because the underslab drainage system would collect perched water that builds to the bottom of the proposed slab instead of collecting water below the groundwater table. However, it there is a possibility that the DEP denies the additional pumping from an underslab drainage system if the pumping rate is considered permanent dewatering to the storm sewers.

Underslab Drainage System

If the basement walls and slab are not designed to resist hydrostatic pressures, then a horizontal underslab drainage system should be installed. For the design of the underslab drainage system, we recommend that drainage pipes be placed within a minimum 18-inch thick layer of $\frac{3}{4}$ -inch crushed stone beneath the cellar slab. The drainage pipes should be a minimum 6-inch diameter, Schedule 40, slotted PVC conforming to ASTM D1785. The piping network should be installed beneath the slab with a maximum spacing of 30 feet on center. Typical clean-out fittings should be incorporated into the underslab drainage system at each change in piping direction.

Drainage piping should extend to multiple suitable gravity outlets or to multiple sump pits for removal by pumping. Multiple outlets or sump pits are recommended to provide redundancy into the drainage system should a pipe clog, etc. The sump and pumping system should be designed by the Mechanical Engineer. As this system is a permanent control measure, a duplex pump scheme is recommended to account for maintenance and emergency situations. Power loss and mechanical equipment failures should be considered. If an underslab drainage system is not used, or the NYC DEP does not allow the drainage system to discharge into the storm sewer system, the basement walls and floor slab should be designed to resist a water pressure resulting from the design water level.

Cellar Wall Drainage System

If the cellar walls are not designed to resist hydrostatic pressures, then a vertical drainage system should be installed behind all below-grade walls. Drainage board should be used against the exterior face of the cellar wall. Weep holes consisting of 4-inch diameter PVC pipe should be provided through the foundation wall at about 10 feet on-center so that groundwater can be collected in the underslab drainage system.

Waterproofing

Regardless of whether a drainage system is used, exterior waterproofing is recommended for below-grade walls and the cellar slab. We recommend that a membrane type waterproofing is used, such as Preprufe and Bituthene products manufactured by Grace. A layer of lean concrete at least 2-inches-thick should be placed over subgrade prior to

installing the waterproofing to provide a smooth substrate. The vertical water-proofing should be protected with plywood, drainage board, or other material to prevent damage during backfilling. A drainage panel should be considered to provide protection for the waterproofing membrane and limit water from accumulating against the foundation walls.

Waterproofing should be tied into the waterproofing of the existing buildings, walls, and slabs to remain. Special details will need to be developed for connections, terminations, and around temporary bracing of the walls. The use of bentonite waterproofing or negative side crystalline waterproofing as the primary barrier is not recommended.

We recommend that a warrantee be obtained from the manufacturer and installer to cover materials and workmanship. Only certified installers should be used to perform the waterproofing work. Diligent protection and quality control is critical in producing a final product that limits the potential for seepage. Repairs should be made as soon as possible and should be made per the manufacturer's recommendations. A representative of the manufacturer should perform a final inspection and approve all work prior to concrete pours.

SITE PREPARATION AND CONSTRUCTION RECOMMENDATIONS

Our recommendations for geotechnical aspects of site preparation and construction are provided below.

Subgrade Preparation

Subgrades for foundations and slabs should be prepared by removing materials loosened by machine excavation to an undisturbed subgrade. Subgrade preparation should be performed under the observation and direction of the geotechnical engineer. Remedial work, if necessary, should be performed as directed by the geotechnical engineer. Before the footings, slabs-on-grade, or slab sub-base is placed, the sand subgrades should be proof compacted using at least 8 passes of a walk-behind vibratory roller having a minimum static weight of 2-tons. Subgrades should be in a firm state after proof compaction.

Subgrades should be protected from the effects of frost, freezing, construction traffic, and surface water runoff. We recommend that the contractor protect subgrades by placing a lean concrete slab (mud mat) over the subgrade immediately upon approval by the special inspector.

Backfill may be required to fill the volume of the excavation outside the limits of the proposed foundations. We recommend backfill be structural fill or flowable controlled low-strength material (CLSM). Structural fill should have less than 10% fines, no particles larger than 3-inches, and at least 90% passing the ¾-inch sieve. Structural fill should be free of organic material, construction debris, frozen soil, other deleterious material, or on surfaces that have not been approved by the on-site geotechnical engineer. Recycled Concrete Aggregate (RCA) material is not acceptable for the underlsab drainage layers, nor for backfill behind retaining walls.

Backfill should be placed to subgrade in loose lifts not to exceed 12-inches. Each lift should be compacted with the same roller described above to achieve 95% of its maximum dry density as determined by the Modified Proctor Test (ASTM D1557). Soils should be within a few percentage points of optimum moisture content at the time of compaction.

Fill placement and compaction is subject to special inspection and testing. The suitability of on-site material for re-use as backfill should be determined during construction by the Owner's geotechnical engineer. Grain size distributions, maximum dry density and optimum water content determinations should be made on representative samples of the proposed fill.

Excavation

The general excavation is planned to extend to about el 62.5, which is about 2 to 5 feet below the loading dock grade and about 17 to 22 feet below park grade. Localized excavations will extend about 5 to 15 feet deeper than general subgrade for the elevator and mechanical pits, and tanks. The excavated material to top of rock likely includes miscellaneous fill material (demolition debris, rock fragments), sand, clay, and cobbles. Excavation of bedrock is probable at the southern portion of the site and for deeper excavations for tanks and pits.

Soil excavation can be performed using conventional earthmoving equipment (e.g., backhoes, excavators, hoe-rams, hand tools). Bedrock excavation will likely require drilling, chipping and/or splitting. The contractor must take appropriate measures to stabilize the work area and prevent lateral movements of the adjacent areas during excavation. Utilities must be protected and supported during the excavation. All excavations should be conducted in accordance with all OSHA requirements including, but not limited to, temporary shoring, using trench boxes, and proper benching. All work plans should be submitted for owner and design team review prior to commencement of excavation operations.

Temporary Excavation Support and Underpinning

Excavation support will be necessary around the perimeter of the excavation for the proposed building. Excavation support options are limited by the horizontal and vertical proximity to the existing museum buildings and to limit excavation in the existing park. Feasible options for excavation support include drilled soldier piles and lagging along the west side of the site, support of the existing slabs to remain with concrete piers and lagging, and support of the existing walls to remain with localized underpinning.

A temporary excavation support system consisting of soldier piles and timber lagging appears to be a feasible option for the west perimeter of the excavation. We recommend that soldier piles are pre-drilled and grouted in place to limit vibrations at the adjacent museum structures and impacts to the park areas. The soldier piles and timber lagging can likely be designed with a single level of lateral bracing (i.e. rakers, tiebacks, etc.),

depending on the depth to proposed subgrade. A combination of external bracing (e.g. soil and rock anchors) and internal bracing (e.g., corner braces) are feasible options for support.

Underpinning will be required where the proposed excavation extends deeper than adjacent building foundations and slabs; especially if the building foundations are not bearing on competent rock. As an alternate to underpinning of the adjacent slabs, concrete pier/buttons with timber lagging can be considered. The piers/buttons with lagging would support soils beneath the slab and prevent undermining of the slab. Underpinning and concrete piers/buttons should extend at least 2-feet below the proposed foundation subgrade. Underpinning should bear on the same bearing material or better bearing material as the material that the foundation being underpinned was bearing on.

Dewatering operations could be required to construct the pit underpinning and concrete piers. Rakers or soil anchors or rock anchors would laterally support the piers and underpinning that are not stable as a cantilever. The individual pits should not exceed 4 feet in width along the wall. Construction of the pits should be sequenced such that there is at least 12 feet between concurrently constructed pits. Wedging and jacking should be performed to limit settlement. The underpinning and concrete piers should be designed and installed in accordance with all OSHA and Building Code requirements.

The lateral pressures from sidewalk, adjacent buildings, and any other surcharge loads should be added as a uniform rectangular pressure applied to the full wall height as 50% of the surcharge load. All adjacent utilities must be protected and supported, as needed. Final design of the temporary excavation support system should be performed by the excavation contractor's Professional Engineer licensed in the state of New York. The Professional Engineer will be responsible for the preparation of excavation drawings showing all locations of shoring, sections showing adjacent conditions and elevations, dimensions and spacing of soldier piles and underpinning piers, dimensions and sequencing of underpinning, elevation of top of grade being supported, and all bracing details. Additionally, the existing buildings should be carefully monitored during the construction work in accordance with the monitoring section herein.

Groundwater Control during Construction

Controlling groundwater will likely be required during excavation, underpinning, subgrade preparation and foundation construction. We anticipate that groundwater (or perched water) seepage during foundation construction will occur close to the top of decomposed rock or the clay layer. We expect that groundwater during foundation work at subgrade and rainwater runoff within the general excavation can be controlled using sump pumping with a submersible pump from gravel lined trenches and pits at a lower elevation than the deepest excavations. Care should be taken to ensure that drainage is provided during all phases of excavation work.

Excavations deeper than about 2 feet below the water table (e.g., piers, elevator pits) may require other dewatering measures, such as wells, to pre-lower the water. Localized water-tight sheeting, trench boxes, or other cutoff systems can also be evaluated for

groundwater control. The Contractor's dewatering system should be adequate for maintaining a "dry" site during normal operating conditions and water should be maintained at least 2 feet below subgrade elevations.

Environmental pretreatment of groundwater, if necessary, is beyond the scope of this report. Also, a permit from the New York City Department of Environmental Protection (NYCDEP) will be required for water discharge; an evaluation will be made by the NYCDEP to check if the local sewers can handle the volume of water.

ADDITIONAL RECOMMENDATIONS

The following sections provide recommendations for satisfying Monitoring and Landmark Preservation Commission Requirements.

Structural Stability Analysis of Adjacent Building Prior to Construction

We recommend a structural stability analysis to be performed for the adjacent buildings to the south and east to evaluate the existing structural conditions of the building prior to demolition, excavation and construction, including underpinning. Specifically, the results of the structural stability analysis will allow for a better understanding of which method would be a feasible option for demolishing the existing buildings at the site and bracing the building during excavation of the site. This analysis may determine that additional measures are needed to brace the adjacent buildings prior to work commencing. The need for structural stability analysis is mandated by Section 1704.19 of the Building Code.

ADDITIONAL RECOMMENDATIONS

The following sections provide recommendations for satisfying Landmark Preservation Commission Requirements, preconstruction conditions documentation, and monitoring at adjacent structures.

Landmarks Preservation Commission Requirements

The site is a landmarked structure. General procedures for avoiding damage to landmarked structures and buildings in historic districts are outlined in TPPN #10/88. TPPN #10/88 defines adjacent properties as being within 90 feet of the site where work is being performed. The monitoring requirements of adjacent properties includes measuring peak particle velocities, monitoring horizontal and vertical deflections of temporary retaining wall structures, monitoring horizontal and vertical deflections of adjacent buildings, groundwater table fluctuations, ground settlements, crack monitoring, preconstruction conditions documentation, and photograph documentation of adjacent buildings.

Preconstruction Conditions Documentation

We recommend that a comprehensive preconstruction conditions survey of the existing museum structures on all sides of the proposed footprint be undertaken prior to any construction activities. We also recommend performing a plumb survey of the adjacent

existing museum structures prior to the start of construction. The plumb survey will document the relative verticality of the adjacent buildings. The surveys would provide the owner and foundation contractor with documentation of existing conditions.

As discussed herein, we also recommend performing a structural stability assessment of the adjacent buildings and below-grade structures prior to finalizing the building plans and start of excavation work at the site. The structural stability assessment should identify structural deficiencies in the adjacent structures so that additional plans can be developed for stabilizing the buildings.

The adjacent structures are old and relatively fragile. The contractor must use prudent measures to monitor, support and protect these structures during all work. The contractor's engineer should examine all nearby buildings before the start of earthwork to develop a protection plan.

Monitoring Program in Adjacent Structures

On the basis of the preconstruction survey, an observational and instrumentation program should be designed for monitoring the performance of adjacent structures and evaluating construction procedures. This program should consist of monitoring horizontal and vertical movements by optical surveying and vibration monitoring using threshold-type seismographs to measure construction-induced vibrations. Depending on the findings of the preconstruction conditions survey, crack gauges should be required to monitor for crack changes inside and/or outside the adjacent structures during work.

There are multiple existing museum structures that will require optical and vibration monitoring for this project.

Vibration Monitoring

Typically, vibration monitors must be installed in each building within 90 feet of proposed construction, spaced no greater than 50 feet. The threshold peak particle velocities (PPV) of 0.5-inches per second for buildings with concrete foundation walls and 0.5 inches per second for building with brick or rubble foundation walls should be considered. These thresholds should be verified or revised based on the results of the preconstruction conditions survey.

Optical Monitoring

A precise optical survey program should be implemented to monitor vertical and horizontal movements of nearby structures and the excavation perimeter including the excavation support system. The survey should be performed a minimum of twice a week, with measurements taken to the nearest 0.005 ft. A fixed off-site reference benchmark should be used. At least two baseline surveys should be made prior to the start of work. Excavation work should be temporarily stopped if movements (vertical or horizontal) exceed about ¼-inch over a single reading or a movement trend develops over several readings.

SERVICES DURING DESIGN, CONSTRUCTION DOCUMENTS AND CONSTRUCTION QUALITY ASSURANCE

During final design we should be retained to consult with the design team as geotechnical questions arise. Technical specifications and design drawings should incorporate Langan's recommendations. When authorized, Langan will assist the design team in preparing specification sections related to geotechnical issues such as earthwork, ground improvement, shallow foundations, deep foundations, backfill and excavation support. Langan should also, when authorized, review the project plans, as well as Contractor submittals relating to materials and construction procedures for geotechnical work, to confirm the designs incorporate the intent of our recommendations.

Langan has investigated and interpreted the site subsurface conditions and developed the foundation design recommendations contained herein, and is therefore best suited to perform quality assurance observation and testing of geotechnical-related work during construction. The work requiring quality assurance confirmation and/or special inspections per the Building Code includes, but is not limited to, earthwork, backfill, ground improvement, shallow and deep foundations, and excavation support.

Recognizing that construction observation is the final stage of geotechnical design, quality assurance observation during construction by Langan is necessary to confirm the design assumptions and design elements, to maintain our continuity of responsibility on this project, and allow us to make changes to our recommendations, as necessary. The foundation system and general geotechnical construction methods recommended herein are predicated upon Langan assisting with the final design and providing construction observation services for the Owner. Should Langan not be retained for these services, we cannot assume the role of geotechnical engineer of record, and the entity providing the final design and construction observation services must serve as the engineer of record.

OWNER AND CONTRACTOR RESPONSIBILITIES

The Contractor is responsible for construction quality control, which includes satisfactorily constructing the foundation system and any associated temporary works to achieve the design intent while not adversely impacting or causing loss of support to neighboring property, structures, utilities, roadways, etc. Construction activities that can alter the existing ground conditions such as excavation, fill placement, foundation construction, ground improvement, pile driving/drilling, dewatering, etc. can also induce stresses, vibrations, and movements in nearby structures and utilities, and disturb occupants. Contractors are solely responsible to ensure that their activities will not adversely affect the structures and utilities, and will not disturb occupants. Contractors must also take all necessary measures to protect the existing structures, utilities, etc. during construction. By using this report, the Owner agrees that Langan will not be held responsible for any damage to adjacent structures, utilities, etc.

The preparation and use of this report is based on the condition that the project construction contract between the Owner and their Contractor(s) will include: 1) Langan

being added to the Project Wrap and/or Contractor's General Liability insurance as an additional insured, and 2) language specifically stating the Foundation Contractor will defend, indemnify, and hold harmless the Owner and Langan against all claims related to disturbance or damage to adjacent structures, utilities, etc. or properties.

LIMITATIONS

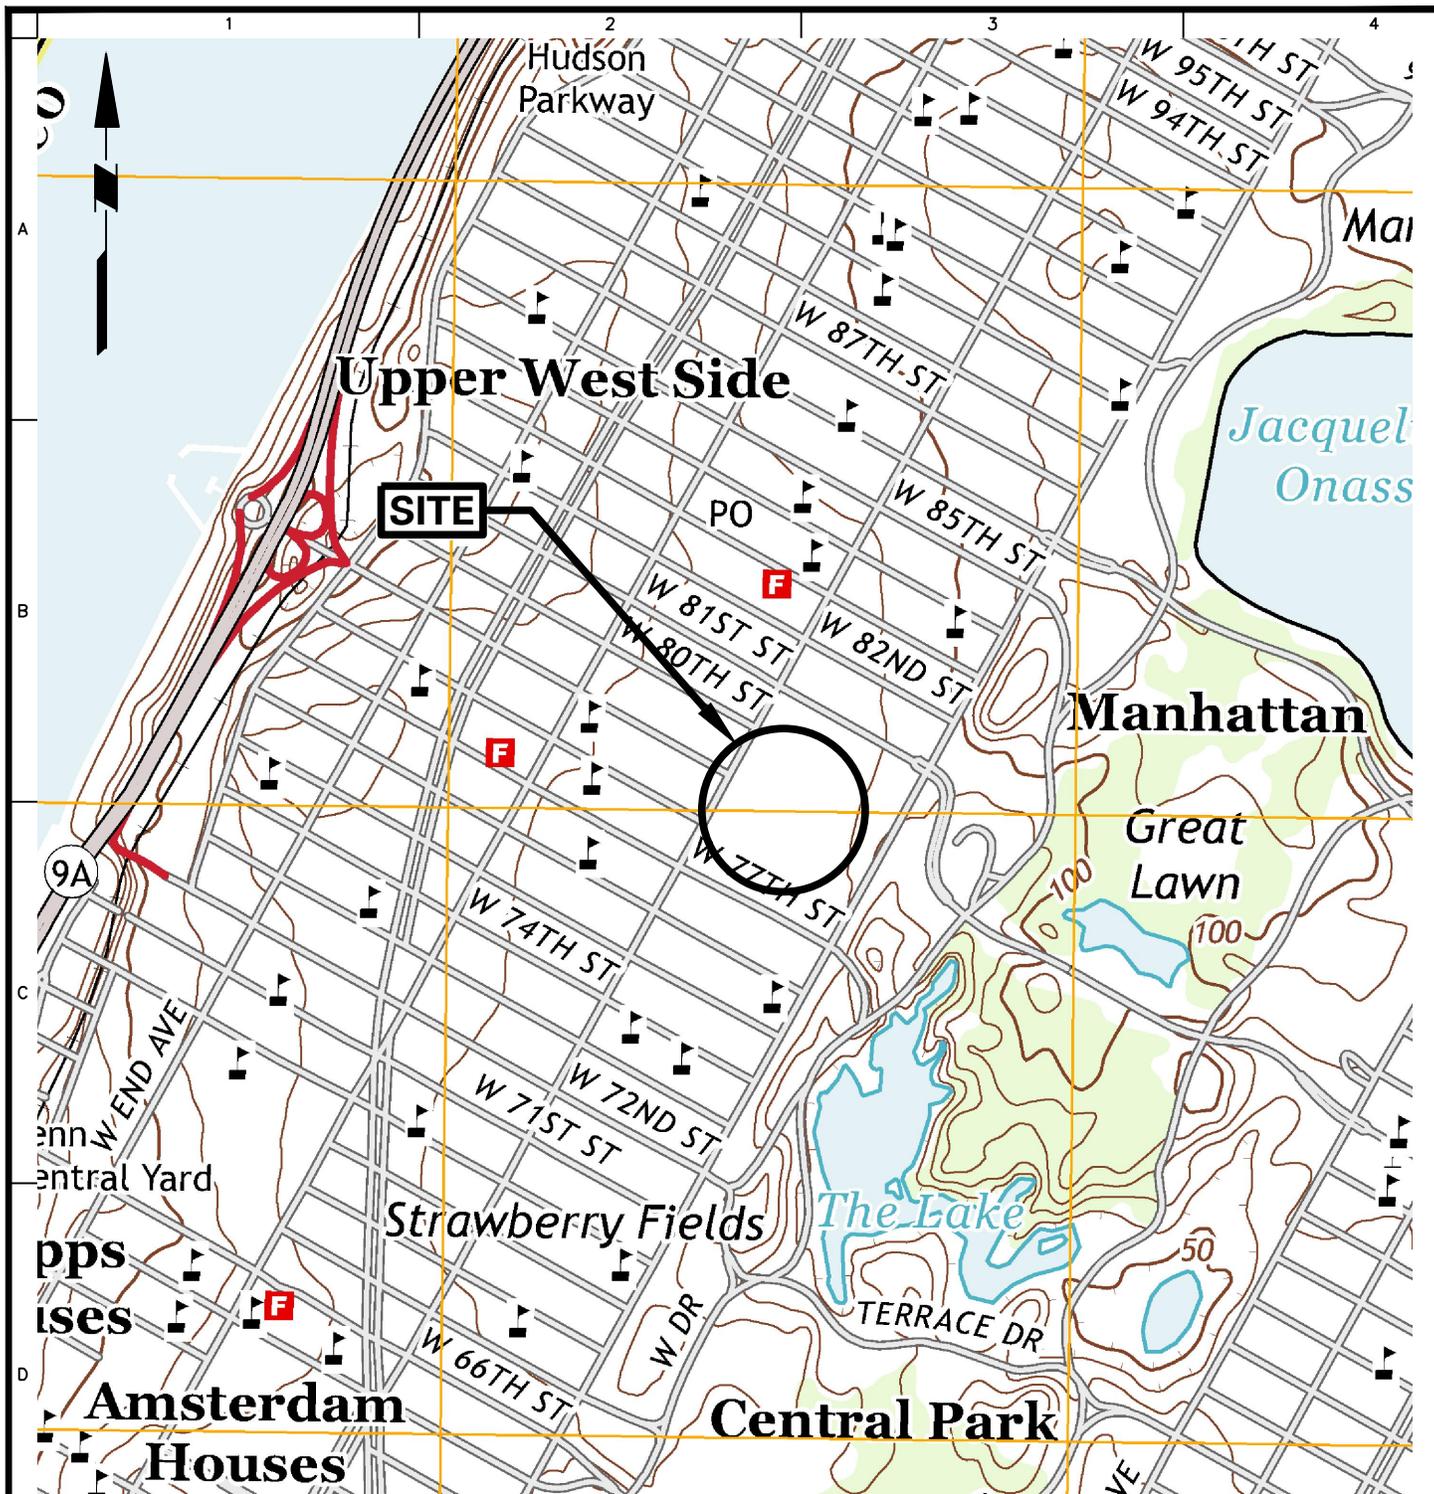

The conclusions and recommendations provided in this report result from our interpretation of the geotechnical conditions existing at the site inferred from a limited number of borings, test pits and other exploration, as well as architectural and structural information provided by Davis Brody Bond and Arup. Actual subsurface conditions may vary. Recommendations provided are dependent upon one another and no recommendation should be followed independent of the others.

Any proposed changes in structures or their locations should be brought to Langan's attention as soon as possible so that we can determine whether such changes affect our recommendations. Information on subsurface strata and groundwater levels shown on the logs represent conditions encountered only at the locations indicated and at the time of investigation. If different conditions are encountered during construction, they should immediately be brought to Langan's attention for evaluation, as they may affect our recommendations.

This report has been prepared to assist the Owner, architect, and structural engineer in the design process and is only applicable to the design of the specific project identified. The information in this report cannot be utilized or depended on by engineers or contractors who are involved in evaluations or designs of facilities (including underpinning, grouting, stabilization, etc.) on adjacent properties which are beyond the limits of that which is the specific subject of this report.

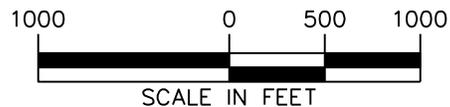

Environmental issues (such as permitting or potentially contaminated soil and groundwater) are outside the scope of this study and should be addressed in a separate evaluation.

GENERAL NOTES:

- EXISTING CONDITIONS AND TOPOGRAPHIC INFORMATION SHOWN ARE TAKEN FROM AN ARCHITECTURAL SURVEY PREPARED BY FEHRINGER SURVEYING, P.C. DATED 6 MARCH 2017.
- PROPOSED GILDER CENTER ADDITION LOCATION BASED ON DRAWING NO. A-101 TITLED "LEVEL 1 PLAN" BY STUDIO GANG ARCHITECTS, DATED 26 FEBRUARY 2016. THE LOCATION IS APPROXIMATE.
- ELEVATIONS ARE REFERENCED TO THE NORTH AMERICAN VERTICAL DATUM 1988, WHICH IS 1.65' ABOVE BOROUGH PRESIDENT OF MANHATTAN DATUM (NAVD88 = BPMD + 1.65'). SURVEY SHOULD BE CONSIDERED APPROXIMATE.
- BORINGS LB-1(OW) THROUGH LB-7(OW), SLB-1 AND SLB-2 WERE PERFORMED BY AQUIFER DRILLING AND TESTING USING A TRACK MOUNTED RIG BETWEEN 2 FEBRUARY AND 1 MARCH 2017 UNDER FULL-TIME SPECIAL INSPECTION BY A LANGAN ENGINEER.
- TEST PITS TP-1 THROUGH TP-14 AND LANDSCAPE TEST PITS LTP-1 THOUGH LTP-5 WERE PERFORMED BY AQUIFER DRILLING AND TESTING BETWEEN 30 JANUARY AND 3 MARCH 2017 UNDER FULL-TIME SPECIAL INSPECTION BY A LANGAN ENGINEER.
- ALL BORING AND TEST PIT LOCATIONS ARE CONSIDERED APPROXIMATE.

EXISTING FOOTING

PROPOSED FOOTING

NOTES:

1. NEW FOOTINGS SHALL BE CONSTRUCTED A MINIMUM OF 2 FOOT BEYOND THE INFLUENCE ZONE OF THE EXISTING FOOTING.
2. FOR A NEW FOOTING CONSTRUCTED AT A HIGHER ELEVATION THAN THE EXISTING FOOTING, THE INFLUENCE ZONE IS DEFINED BY A LINE WITH A 1.5H:1V SLOPE EXTENDING UPWARD FROM THE BASE OF THE EXISTING FOOTING.
3. FOR A NEW FOOTING CONSTRUCTED AT A LOWER ELEVATION THAN THE EXISTING FOOTING, THE INFLUENCE ZONE IS DEFINED BY A LINE WITH A 1.5H:1V SLOPE EXTENDING DOWNWARD FROM THE BASE OF THE EXISTING FOOTING.

1:45PM end of day

2/10/17
 -Arrived on site at 7:00AM
 -7:20AM ADT arrived and began mobilizing rig
 -8:55AM removed spoon (S-10) that was left on 2/8/17
 -Advanced casing to 40ft
 Gear line from rig broke, ADT called shop to get replacement

2/16/17
 -Arrived on site at 7:00AM
 -Begin coring at 9:50AM (ADT fix the gear line, 8AM to 9:45AM)
 -Boulder between 40ft-45ft. No rock encountered.

Began coring through rock. Smooth drilling, no loss of water or pressure throughout coring.

Longer coring time than usual (denser rock expected).

End of boring at 33ft

95

Advanced drill to 20ft to verify if we are still within rock layer.

Hammered 3" casing to 25ft to begin rock coring.

End of boring at 35ft.

| PROJECT American Museum of Natural History | | | PROJECT NO. 170132489 | | | | | | | | | | | | | | | | | | | | | | | |
| LOCATION Manhattan, NY | | | ELEVATION AND DATUM About el. 82 (NAVD88) | | | | | | | | | | | | | | | | | | | | | | | |
| DRILLING AGENCY Aquifer Drilling & Testing | | | DATE STARTED 2/15/2017 | | DATE FINISHED 2/17/2017 | | | | | | | | | | | | | | | | | | | | | |
| DRILLING EQUIPMENT Ecco Diesel Track Mounted Rig | | | DRILLER Anatoliy Kholidilin | | | | | | | | | | | | | | | | | | | | | | | |
| SIZE AND TYPE OF BIT 3-7/8" Tri-cone Roller Bit | | | INSPECTOR Sebastian Tinazzi | | | | | | | | | | | | | | | | | | | | | | | |
| METHOD OF INSTALLATION The boring was drilled by a 3 7/8" tricone roller bit to approximately 47 ft below grade. A 2-inch diameter PVC screen 10 ft long and a 37 ft long riser was installed. The annulus around the slotted PVC pipe was backfilled with silica sand to about 2 feet above the screen, followed by 2-foot-thick bentonite pellet seal and the remaining annulus was backfilled with soil cuttings. | | | | | | | | | | | | | | | | | | | | | | | | | | |
| METHOD OF WELL DEVELOPMENT The observation well was flushed with water until the return water was clean. | | | | | | | | | | | | | | | | | | | | | | | | | | |

APPENDIX B
TEST PIT DESCRIPTIONS AND SKETCHES

Test Pit TP-1

Test Pit TP-1 was excavated in the loading dock adjacent to the eastern wall of the sprinkler room and south of the cellar entrance to Building 17. The plan dimensions of the test pit were about 4 feet (north-south) by 3 feet (east-west). TP-1 was excavated to about 3 feet deep.

The loading dock slab, at about el. 65.5 NAVD88, consisted of a 12- to 15-inch-thick reinforced concrete slab. The slab was underlain by fill consisting of brown medium to fine sand, with varying amounts of silt, gravel, and cobbles. An about 2.5-foot by 2.5-foot concrete footing supporting the sprinkler room column is bearing about 3 feet deep. An about 18-inch-thick concrete slab was encountered throughout the bottom of the test pit. The concrete is speculated to be part of a utility trench. The project team decided to end the test pit at the top of the concrete.

Test Pit TP-1A

Test Pit TP-1A was excavated from the loading dock area along the southern wall of Building 17, and adjacent to elevator pit and column for the Building 16 overhang extension. The plan dimensions of the test pit were about 5 feet (north-south) by 4 feet (east-west). TP-1A was excavated to a depth of about 10.5 feet deep.

The loading dock slab, at about el. 66 NAVD88, consisted of a 12-inch-thick reinforced concrete slab. The slab was underlain by fill consisting of brown medium to fine sand, with varying amounts of silt, gravel, and cobbles. Water was encountered about 8 feet below the top of slab.

The bottom of the southern wall of Building 17 was about 7-feet deep, underlain by brown medium to fine sand, with varying amounts of silt, gravel, and cobbles. A footing at the southern wall of Building 17 was encountered at the northwest corner of the test pit. The footing extends to the south by 2.5 to 3-feet from the face of the southern wall. Langan observed the footing bearing on Building Code Class 1c bedrock about 10.5 feet below the loading dock top of slab. The concrete footing under the column of the Building 16 overhang extension is about 2-feet wide in the north-south direction. The footing depth matches the Building 17 footing.

Photo No. 3: TP-1A, General view of the test pit (View: North)

Photo No. 4: TP-1A, View of the Building 16 overhang column footing (View: Southwest)

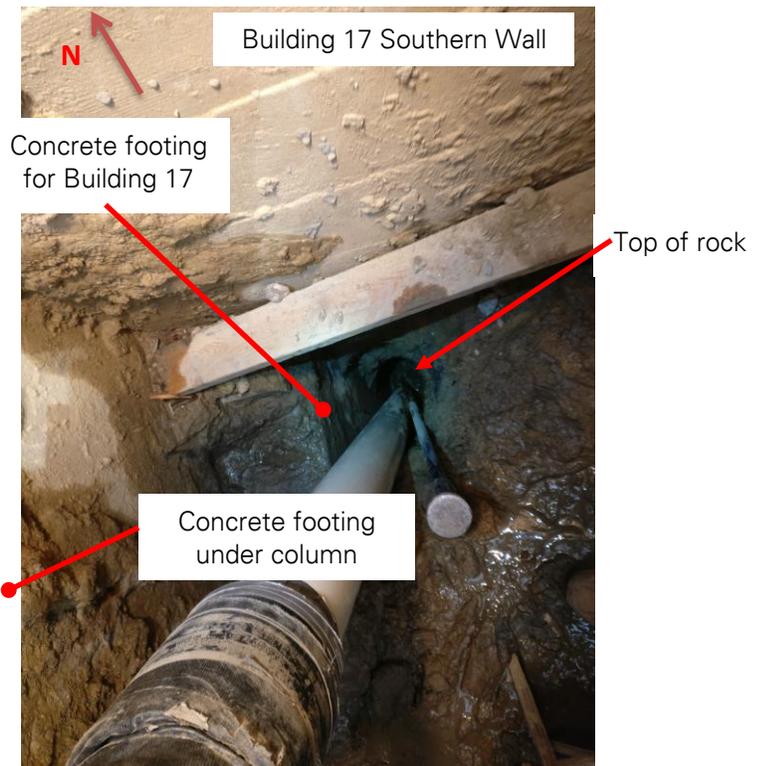

Photo No. 5: TP-1A, View of Building 17 Southern Wall Foundation (View: Northeast)

Test Pit TP-2

Test Pit TP-2 was excavated adjacent to a column in the cellar level of Building 16. The plan dimension of the test pit was about 3.5-feet by 3.5-feet. TP-2 was excavated to about 6 feet deep.

The cellar slab, at about el. 64 NAVD88, consisted of an about 12-inch-thick reinforced concrete slab. The slab was underlain by fill consisting of brown medium to fine sand, with varying amounts of silt, gravel, and cobbles. Water was encountered about 4-feet below the top of slab.

The test pit exposed the edge of a concrete footing supporting the existing column. The footing extends 1-foot-6-inches (north-south direction) and 3-feet (east-west direction) from the center line of the column. Langan observed the footing bearing on Building Code Class 1c bedrock about 4 feet below the cellar top of slab.

(View: Southeast)

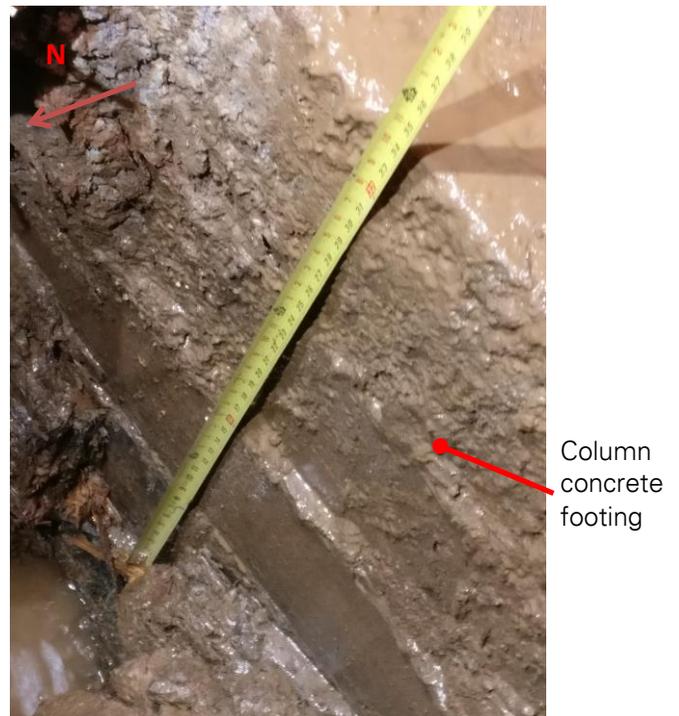

Photo No. 8: TP-2, General View of test pit
(View: East)

Photo No. 7: TP-2, Close-Up View of test pit
(View: Southeast)

Test Pit TP-3

Test Pit TP-3 was excavated from the cellar level of Building 15, adjacent to an interior column and dynamo foundation. The plan dimensions of the test pit were about 3 feet (north-south) by 5 feet (east-west). TP-3 was excavated to about 11 feet deep.

The cellar slab, at about el. 68 NAVD88, consisted of a 4 inch thick unreinforced concrete slab. The slab was underlain by an about 4-inch-thick layer of bricks, which were underlain by fill consisting of brown medium to fine sand, with varying amounts of silt, gravel, and decomposed rock fragments. Water was encountered about 10-feet below the top of slab.

The interior column was supported by a brick footing that extends about 1-foot (north-south) from the edge of the column. Langan observed the footing bearing on Building Code Class 1d bedrock (decomposed rock) about 10 feet below the cellar top of slab. The test pit also exposed the bottom of the dynamo mat foundation bearing in the fill about 4-feet below the cellar top of slab.

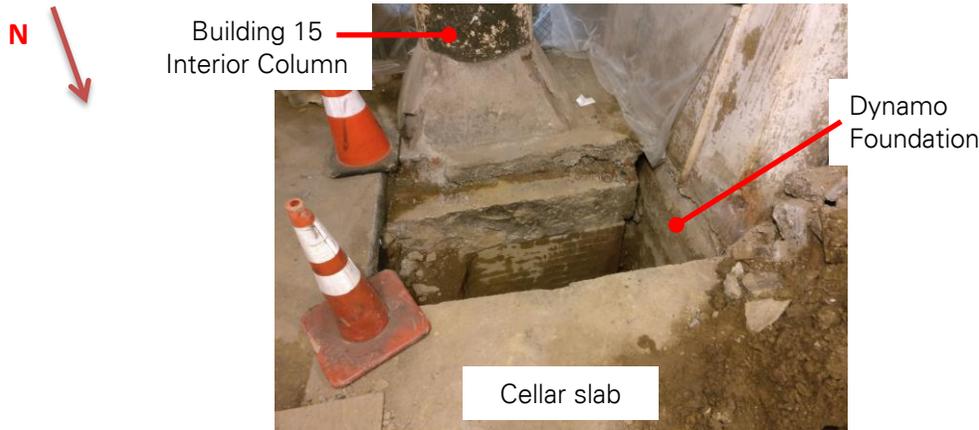

Photo No. 9: TP-3, General view of the test pit (View: South)

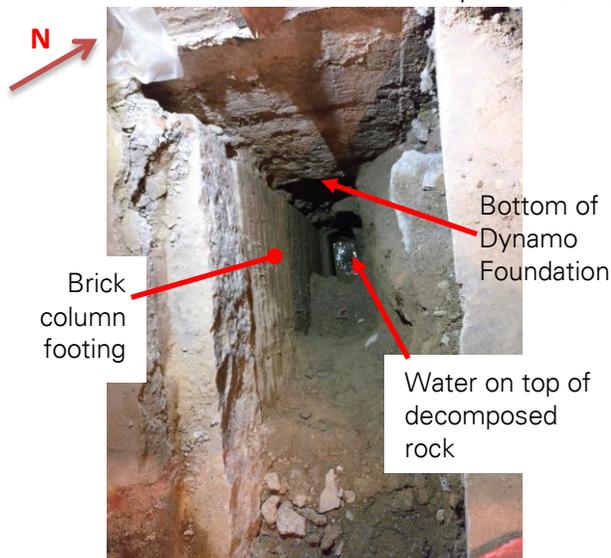

Photo No. 10: TP-3, View of foundations (View: Northwest)

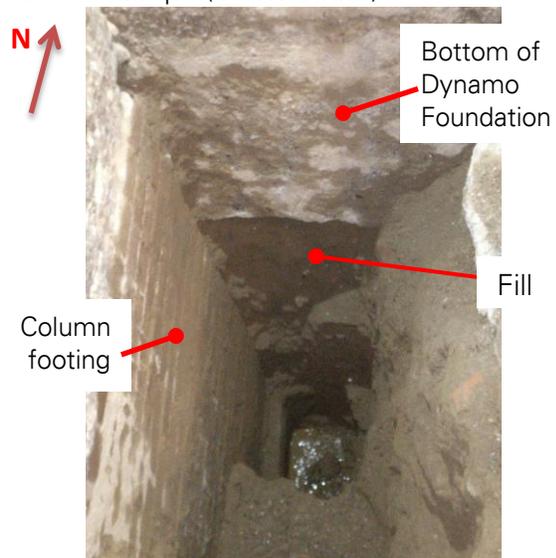

Photo No. 11: TP-3, Close-Up View of foundations (View: North)

Test Pit TP-4

Test Pit TP-4 was excavated from the cellar level adjacent to the eastern wall of Building 7A (that separates Buildings 7 and 7A) and a perpendicular interior wall. The plan dimensions of the test pit were about 3-feet (north-south) by 4.5-feet (east-west). TP-4 was excavated to about 8 feet deep.

The cellar slab, at about el. 67 NAVD88, consisted of a 4-inch thick unreinforced concrete slab. The slab was underlain by fill consisting of brown medium to fine sand, with varying amounts of silt, gravel, cobbles, and decomposed rock fragments. Water was encountered about 8 feet below the top of slab.

The test pit exposed a concrete strip footing supporting the eastern wall of Building 7A. The footing extends flush with the wall to about 1.5-feet-deep. The footing extends (east-west) about 4-inches from the face of the wall from about 1.5- to 5-feet-deep. The footing extends by an additional about 6 inches to about 5.5-feet-deep. Langan observed the footing bearing in the fill about 5.5-feet below the cellar top of slab.

The test pit also exposed the edge of a stone footing supporting the interior wall. The footing extends about 4-inches (north-south) from the face of the wall. Langan observed the footing bearing on Building Code Class 1c bedrock about 8 feet below the cellar top of slab.

Photo No. 12: TP-4, General view of the test pit (View: East)

Photo No. 13: TP-4, View of foundation footings (View: East)

Test Pit TP-5

Test Pit TP-5 was excavated from the loading dock, adjacent to the western exterior column at the interface of Buildings 15 and 15A. The plan dimensions of the test pit were about 4.5-feet (north-south) by 5.5-feet (east-west). TP-5 was excavated to about 12 feet deep.

The loading dock slab, at about el. 69 NAVD88, consisted of a 12-inch-thick reinforced concrete slab. The slab was underlain by fill consisting of brown medium to fine sand, with varying amounts of silt, gravel, cobbles, and decomposed rock fragments. Water was encountered about 7.5 feet below the top of slab.

The test pit exposed a stone footing supporting the existing column. The footing extends about 10-inches (north-south) and about 1-foot (east-west) from the face of the column. No bonding material was observed between the stones. Langan observed the footing bearing on Building Code Class 1d bedrock (decomposed rock) about 12 feet below the loading dock top of slab. A stone strip-footing supporting the Building 15 western wall protrudes about 9-inches from the face of the wall. Langan observed the footing bearing in the fill about 2-feet below the cellar top of slab.

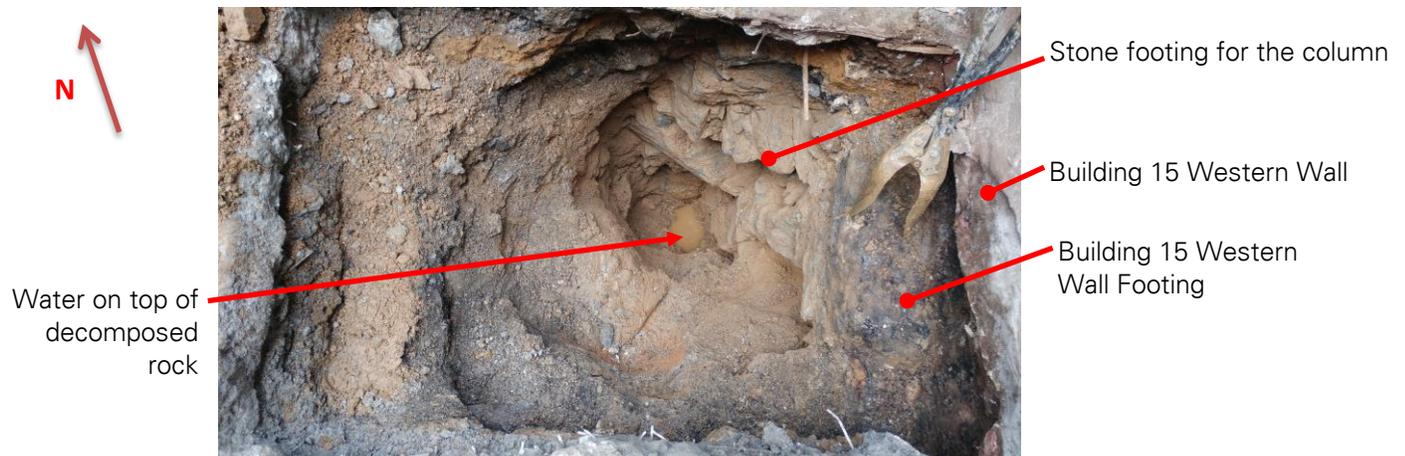

Photo No. 14: TP-5, General view of the test pit (View: North)

Photo No. 15: TP-5, Close-Up View of foundation footings (View: East)

Test Pit TP-6

Test Pit TP-6 was excavated from the loading dock adjacent to the southwest corner of Building 7. The plan dimensions of the test pit were about 4-feet (north-south) by 3.5-feet (east-west). TP-6 was excavated to about 7 feet deep.

The loading dock slab, at about el. 67 NAVD88, is an about 6-inch-thick reinforced concrete slab. The slab was underlain by about 12-inches of gravel, underlain by fill consisting of brown medium to fine sand, with varying amounts of silt and gravel.

The concrete footing supporting the corner of the south and west walls of Building extends about 10-inches (north-south) and about 2.5-feet (east-west) from the face of the corner. Langan observed the footing bearing on Building Code Class 1c bedrock about 4 feet below the loading dock top of slab. The western wall is supported by a strip footing, flush with the face of the wall, and bearing on Building Code Class 1c bedrock up to about 7 feet below the loading dock top of slab.

Photo No. 16: TP-6, General view of the test pit (View: East)

Photo No. 17: TP-6, View of foundations (View: South)

Test Pit TP-7

Test Pit TP-7 was excavated from the loading dock, adjacent to the western perimeter wall of Building 1. The plan dimensions of the test pit were about 4-feet by 4-feet. TP-7 was excavated to about 3 feet deep.

The loading dock slab, at about el. 67 NAVD88, is an about 7-inch-thick reinforced concrete slab. The slab was underlain by about a 5-inch-thick gravel layer, which was underlain by a layer decomposed rock.

The test pit exposed a concrete strip footing supporting the western perimeter wall of Building 1. The footing extends to the northwest by about 2.5-feet from the face of the wall. Langan observed the footing bearing on Building Code Class 1c bedrock about 1.5 feet below the loading dock top of slab.

Photo No. 18: TP-7, General view of the test pit (View: East)

Photo No. 19: TP-7, View of foundations (View: East)

Test Pit TP-8

Test Pit TP-8 was excavated from the loading dock, adjacent to a column supporting Building 11B. The plan dimensions of the test pit were about 3-feet by 3-feet. TP-8 was excavated to about 6.5-feet deep.

The loading dock slab, at about el. 67 NAVD88, is a 12-inch-thick unreinforced concrete slab. The slab was underlain by fill consisting of brown medium to fine sand, with varying amounts of silt, gravel, and decomposed rock fragments. Water was encountered about 5 feet below the loading dock top of slab.

The test pit exposed a concrete footing that extends about 4-inches (north-south) from the face of the column. Langan observed the footing bearing on Building Code Class 1c bedrock about 6.5 feet below the loading dock top of slab.

Photo No. 20: TP-8, General view of the test pit (View: North)

Photo No. 21: TP-8, View of foundation (View: Northeast)

Test Pit TP-9

Test Pit TP-9 was excavated from the loading dock under Building 8, adjacent to the north wall of Building 8. The plan dimensions of the test pit were about 3.5-feet by 3.5-feet. TP-9 was excavated to about 4 feet deep.

The loading dock slab, at about el. 66 NAVD88, is an about 10-inch-thick reinforced concrete slab. The slab was underlain by fill consisting of gray medium to fine sand, with varying amounts of silt, gravel, and cobbles. Water was encountered about 2.5 feet below the loading dock top of slab.

The test pit exposed a brick wall approximately flush with the northern wall of Building 8, and a 6-inch-diameter iron pipe which extends (north-south) from the face of the wall, about 2 feet below the loading dock. The pipe obstructed excavation of the test pit causing the bottom of the wall to not be exposed. Langan observed Building Code Class 1c bedrock about 4 feet below the loading dock top of slab, and the northern wall is anticipated to bear on the rock.

Photo No. 22: TP-9, General view of the test pit (View: North)

Test Pit TP-10

Test Pit TP-10 was excavated from the loading dock area, adjacent to the northeast corner of the Building 8 stair tower addition and adjacent to a column for the Building 11B overhang. The plan dimensions of the test pit were about 3.5-feet by 3.5-feet. TP-10 was excavated to about 4.5-feet deep.

The loading dock slab, at about el. 67 NAVD88, is about 4- to 6-inch-thick reinforced concrete. The slab is underlain by concrete (possibly from the Building 11B Column footing) and decomposed rock. Water was encountered about 4 feet below the loading dock top of slab.

The test pit exposed a concrete strip-footing supporting the eastern wall of the Building 8 stair tower. Langan observed the footing bearing on Building Code Class 1d rock (decomposed rock) about 4 feet below the loading dock top of slab.

The test pit also exposed a concrete footing supporting the column. The footing extends about 6-inches (north-south) from the face of the column. Langan observed the footing bearing on Building Code Class 1c bedrock about 4.5 feet below the loading dock top of slab.

Strip footing

Bedrock

Test Pit TP-11

Test Pit TP-11 was excavated from the loading dock, adjacent to the northern perimeter wall of Building 11. The plan dimensions of the test pit were about 4-feet (north-south) by 3.5-feet (east-west). TP-11 was excavated to about 3.5-feet deep.

The loading dock slab, at about el. 67 NAVD88, is an about 8-inch-thick reinforced concrete slab. The slab was underlain by an about 4-inch-thick gravel layer, underlain by fill consisting of brown medium to fine sand, with varying amounts of brick, concrete, gravel, and decomposed rock fragments.

The test pit exposed a concrete strip footing supporting the northern wall of Building 11. The footing is flush with the face of the wall to about 2-feet below top of loading dock slab. The footing then extends to north by about 6-inches from the face of the wall from about 2- to 3-feet below top of slab. The footing steps an additional 8-inches from the face of the wall to the base of the footing. Langan observed the footing bearing on Building Code Class 1c bedrock about 3.5 feet below the loading dock top of slab.

Photo No. 25: TP-11, General view of the test pit (View: South)

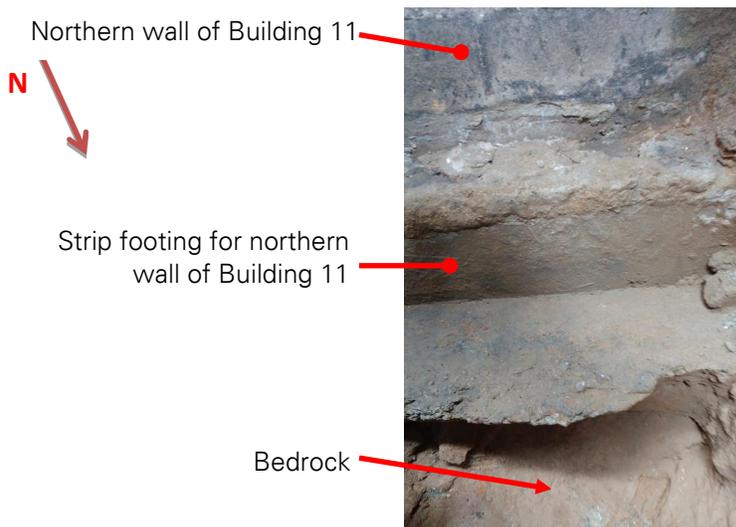

Photo No. 26: TP-11, View of the foundations (View: South)

Test Pit TP-12

Test Pit TP-12 was excavated from the base of the vehicular ramp, adjacent to the stone retaining wall that separates the park from the ramp. The plan dimensions of the test pit were about 3-feet by 3-feet. TP-12 was excavated to about 2.5-feet deep.

The vehicular ramp, at about el. 68.5 NAVD88, consist of 6-inch-thick cobble stones. The cobble stones were underlain by an 8-inch-thick concrete slab. Water was encountered about 1.5 feet below the top of the vehicular ramp.

The test pit exposed the stone strip-footing of the existing retaining wall. The footing extends about 13-inches (north-south) from the face of the wall. Langan observed the footing bearing on Building Code Class 1c bedrock about 1.5 feet below the top of the vehicular ramp.

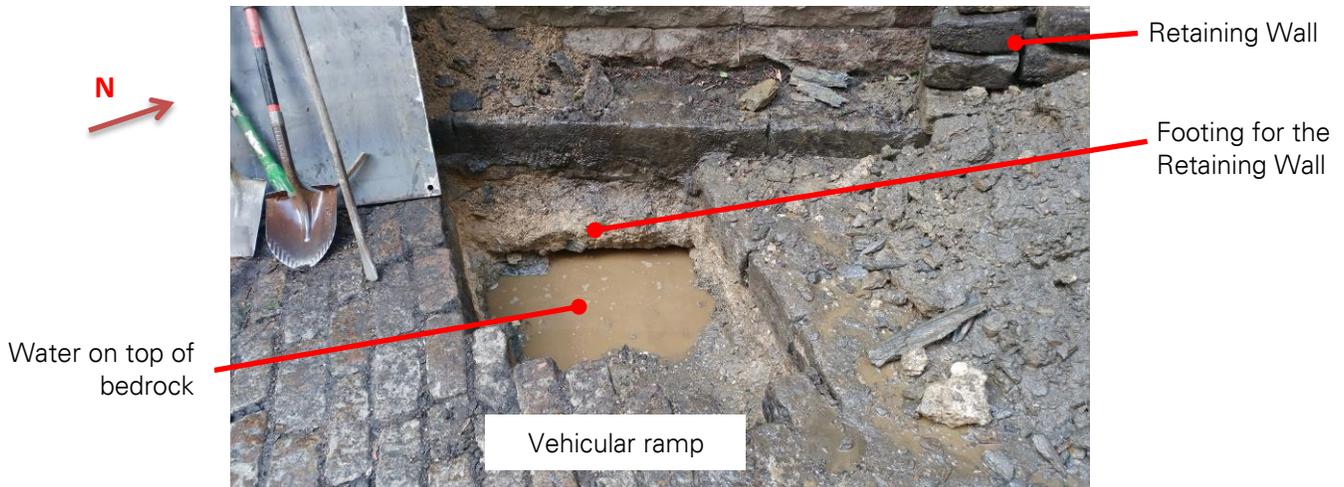

Photo No. 27: TP-12, General view of the test pit (View: West)

Test Pit TP-13

Test Pit TP-13 was excavated from the vehicular ramp, adjacent to the base of the landscaping retaining wall. The plan dimensions of the test pit were about 2-feet by 2-feet. TP-13 was excavated about 2 feet deep.

The vehicular ramp, at about el. 70.5 NAVD88, consisted of about 6-inch-thick cobble stones underlain by an about 6-inch-thick unreinforced concrete slab. The concrete was underlain by fill consisting of brown medium to fine sand, varying amounts of roots, gravel, and cobbles.

The test pit exposed the concrete strip-footing supporting the existing landscaping retaining wall. Langan observed the footing bearing on Building Code Class 1c bedrock about 2 feet below the top of the vehicular ramp.

Test Pit TP-14

Test Pit TP-14 was excavated from the vehicular ramp, adjacent to the landscaping retaining wall. The plan dimensions of the test pit were about 3-feet by 3-feet. TP-14 was excavated to about 1.5-feet deep.

The vehicular ramp, at about el. 74.5 NAVD88, consisted of about 6-inch-thick cobble stones underlain by an about 6-inch-thick unreinforced concrete slab.

The test pit exposed the concrete strip-footing supporting the landscaping retaining wall. The footing extends about 9-inches (east-west) from the face of the retaining wall. Langan observed the footing bearing on Building Code Class 1c bedrock about 1-foot below the top of the vehicular ramp.

Photo No. 30: TP-14, General view of the test pit (View: East)

Photo No. 31: TP-14, View of the foundations (View: East)

Test Pit LTP-1

Test Pit LTP-1 was excavated in the park, about 5 feet north of Boring LB-3. The plan dimensions of the test pit were about 3-feet by 3-feet. LTP-1 was excavated to about 3-feet below park grade.

At existing grade, about el. 84 NAVD88, there was an about 6- to 12-inch-thick top soil layer underlain by fill layer consisting of brown medium to fine sand, varying amounts of silt, brick, gravel, cobbles, and decomposed rock fragments. The fill extended to the bottom of the test pit.

Photo No. 32: LTP-1, General view of the test pit (View: North)

Test Pit LTP-2

Test Pit LTP-1 was excavated in the park, in the enclosed triangular area west of the museum entrance. The plan dimensions of the test pit were about 3-feet by 3-feet. LTP-2 was excavated to about 3-feet below park grade.

At existing grade, about el. 83.5 NAVD88, there was an about 8- to 12-inch thick top soil layer, underlain by fill consisting of brown medium to fine sand, varying amounts of silt, brick, gravel, cobbles, and decomposed rock fragments. The fill extended to the bottom of the test pit.

Photo No. 33: LTP-2, View of the test pit (View: Northeast)

Test Pit LTP-3

Test Pit LTP-3 was excavated in the park, about 40 feet east of the property line fence. The plan dimensions of the test pit were about 3-feet by 3-feet. LTP-3 was excavated to about 3-feet deep.

At existing grade, about el. 84 NAVD88, there was an about 9-inch-thick top soil layer, underlain by fill consisting of brown medium to fine sand, varying amounts of silt, brick, gravel, cobbles, and decomposed rock fragments. The fill extended to the bottom of the test pit.

Photo No. 34: LTP-3, General view of the test pit (View: South)

Test Pit LTP-4

Test Pit LTP-4 was excavated in the park, about 20 feet west of Building 17. The plan dimension of the test pit was about 3-feet by 3-feet. LTP-4 was excavated to about 3-feet deep.

At existing grade, about el. 80.5 NAVD88, there was a 12-inch-thick top soil layer, underlain by fill consisting of brown medium to fine sand, varying amounts of silt, brick, gravel, cobbles, and decomposed rock fragments. The fill extended to the bottom of the test pit.

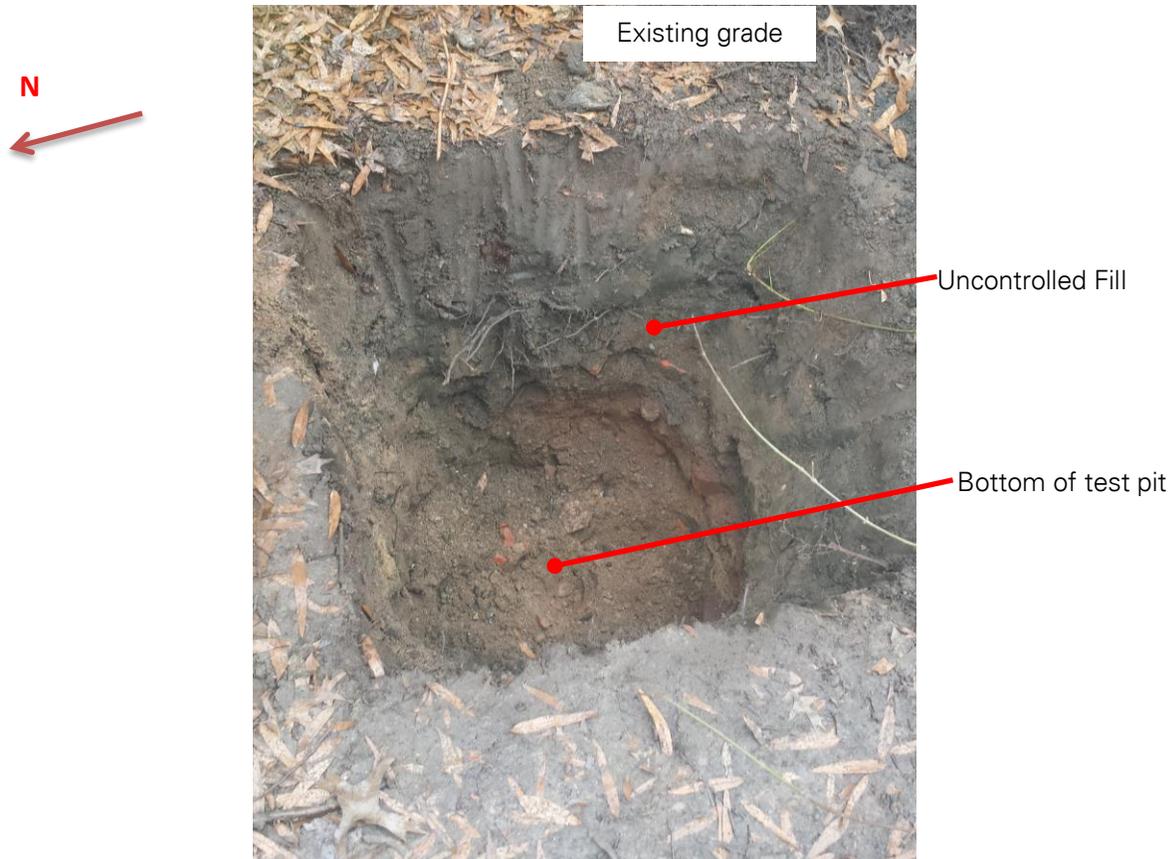

Photo No. 35: LTP-4, General view of the test pit (View: Southeast)

Test Pit LTP-5

Test Pit LTP-5 was excavated in the park, adjacent to a stone pillar at the gate entrance to the park from Columbus Avenue. The plan dimensions of the test pit were about 3-feet by 3-feet. LTP-5 was excavated to about 3-feet deep.

At existing grade, about el. 85.5 NAVD88, there was a 9-inch-thick top soil layer, underlain by fill consisting of brown medium to fine sand, with varying amounts of silt, gravel, and decomposed rock fragments.

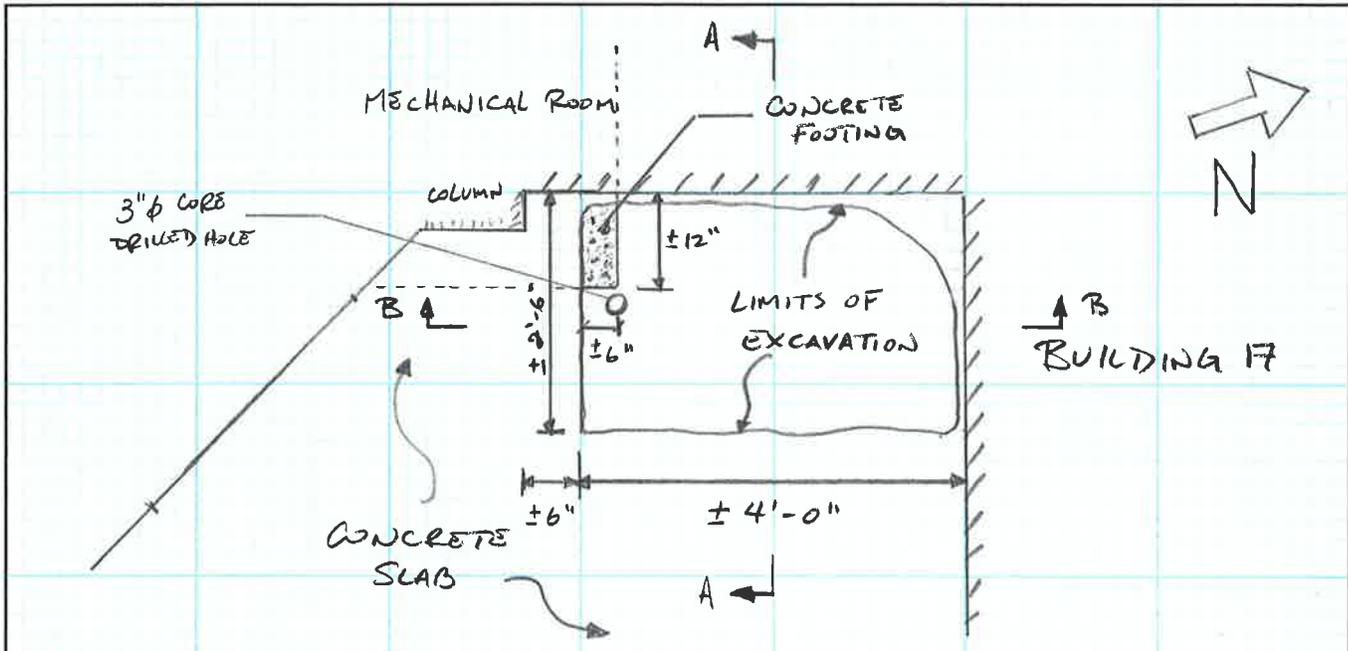

The test pit exposed a concrete pedestal supporting the stone pillar. The pedestal extends by about 1.5-feet (north-south) from the face of the pillar. A stone footing supports the concrete pedestal about 2 feet below grade. Langan observed the footing bearing in the fill about 3-feet below the park grade.

Laboratory Measurement of Soil Resistivity Using the Wenner Four-Electrode Method by ASTM G57 (Laboratory Measurement)

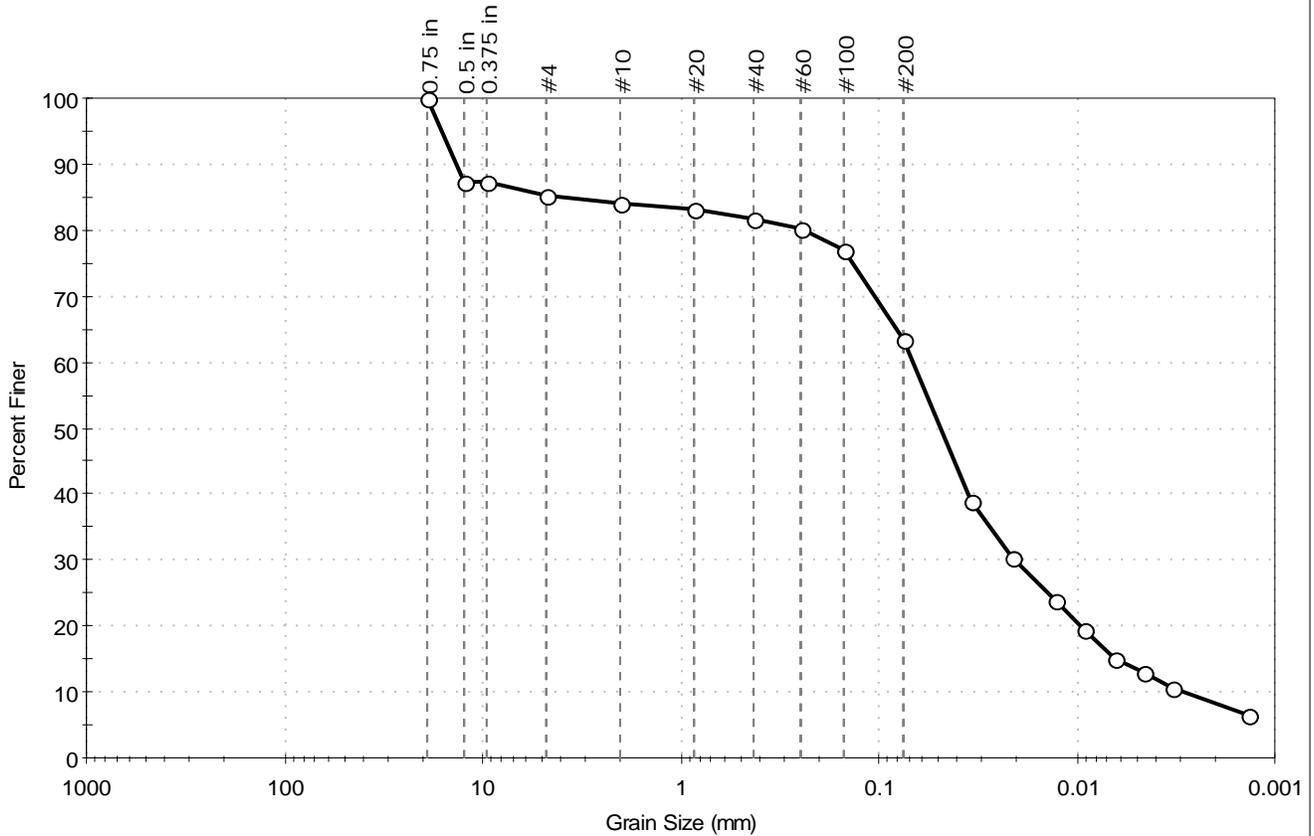

| Boring ID | Sample ID | Depth, ft. | Sample Description | Electrical Resistivity, ohm-cm | Electrical Conductivity, (ohm-cm) ⁻¹ |
|-----------|-----------|------------|-------------------------|--------------------------------|---|
| S-3 | LB-6 | 5-7 | Moist, brown silty clay | 3,822 | 2.62E-04 |

Notes: Test Equipment: Nilsson Model 400 Soil Resistance Meter, MC Miller Soil Box
Water added to sample to create a thick slurry prior to testing (saturated condition).
Electrical Conductivity is calculated as inverse of Electrical Resistivity (per ASTM G57)
Test conducted in standard laboratory atmosphere: 68-73 F

Axial Point Load Strength Index of Rock by ASTM D5731

| Test No. | Specimen Depth | Diameter, in | Thickness, in | Failure Load (P), lb | De, sq in | De, in | Is, psi | F | Is(50mm) psi | Generalized Correction Factor, K | Estimated Compressive Strength, psi |
|----------|----------------|--------------|---------------|----------------------|-----------|--------|---------|-------|--------------|----------------------------------|-------------------------------------|
| PLA-1 | 11-16 ft | 1.98 | 0.90 | 226 | 2.27 | 1.51 | 100 | 0.887 | 88 | 18 | 1,790 |

| | | |
|---|---|--------------------------------|
|  <p>PLA-1</p> <p>Before</p> |  <p>PLA-1</p> <p>After</p> | <p>Intact Material Failure</p> |
|---|---|--------------------------------|

Notes: Generalized correction factor, K, used to estimate the compressive strength based on the specimen depth and ASTM D5731 Table 1.

The reported thickness (L) is the average of three measurements.

The reported diameter(D) is the average of three measurements.

De = the equivalent core diameter

Is = the uncorrected point load strength index

F = the size correction factor

Is(50) = the size corrected point load strength index

**Bulk Density and Compressive Strength
of Rock Core Specimens by ASTM D7012 Method C**

| Boring ID | Sample Number | Depth | Bulk Density, pcf | Compressive strength, psi | Failure Type | Meets ASTM D4543 | Note(s) |
|------------|---------------|----------|-------------------|---------------------------|--------------|------------------|---------|
| LB-01 (OW) | C-1 | 37-42 ft | 168 | 11799 | 1 | Yes | --- |

Notes: Density determined on core samples by measuring dimensions and weight and then calculating.
 All specimens tested at the approximate as-received moisture content and at standard laboratory temperature.
 The axial load was applied continuously at a stress rate that produced failure in a test time between 2 and 15 minutes.
 Failure Type: 1 = Intact Material Failure; 2 = Discontinuity Failure; 3 = Intact Material and Discontinuity Failure

Overview

Job Date: March 23, 2017

Job Site: **American Museum of Natural History**
Central Park West & 79th St.
New York, NY 10024

Client: AKRF, Inc.
440 Park Ave. South
New York, NY 10016

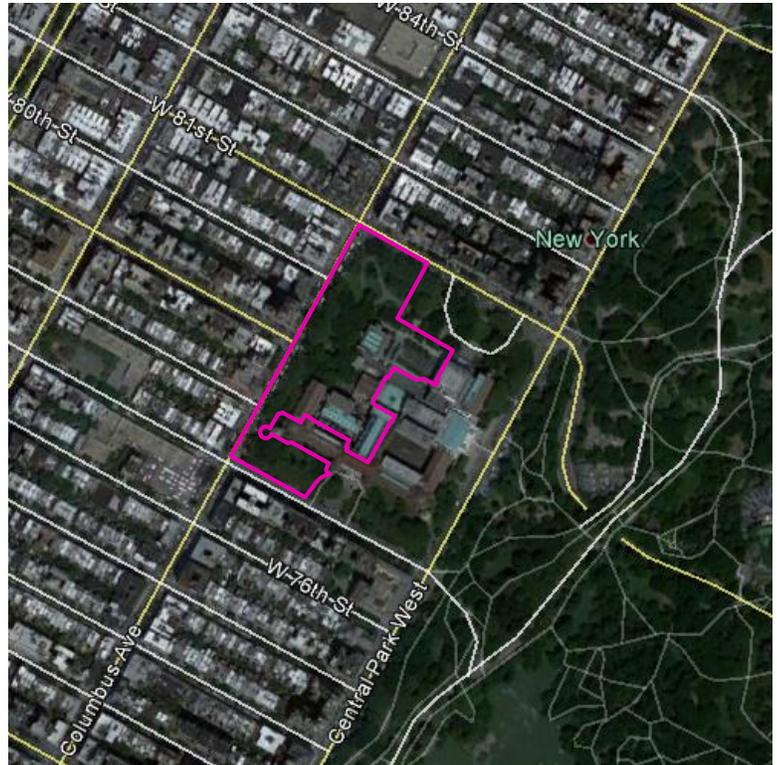

fig. 1 – job site location. work area outlined in pink. imagery © Google.

On Point personnel on site:

- Steven Strahmann
- Steven Guzman

Equipment on site:

- Utility locator: Vivax-Metrotech VM810
- Utility locator: Radiodetection RD8000 PDL / Tx-10b
- Ground-penetrating radar: GSSI UtilityScan DF 800/300 MHz
- Ground-penetrating radar: GSSI UtilityScan 400 MHz

Equipment Capabilities

Radio-Frequency Locating

- Principle of operation:
 - Radio-frequency (RF) locating uses a radio receiver, typically handheld, to detect a radio signal from a buried utility.
 - The radio signal may be passively produced by the utility in the course of its normal function (signaling lines, alternating current, etc.) or introduced into the utility line by a radio transmitter.

- Typical applications:
 - Conductive utilities
 - Steel or copper pipes (water service, gas service)
 - Copper telecommunications cables
 - Tracer lines on non-conductive utilities

- Limitations:
 - RF locating requires a conductive object (pipe, cable, conduit, or tracer) into which a radio signal can be introduced. The signal cannot travel through non-conductive (insulating) materials. The signal may be interrupted or lost on a conductive utility that is not continuous (damaged, broken, corroded, repaired with non-conductive materials, or constructed of segments with non-conductive gaskets, i.e. rubber)
 - RF locating requires some level of access or prior knowledge to effectively introduce the radio signal.
 - An exposed portion (or end) of the utility is needed for direct connection, or inductive clamp.
or
 - A point of well-known location and direction is needed for an inductive drop.
 - RF locating signals are susceptible to “bleeding” onto nearby conductive utilities. Due care will be taken to recognize and minimize bleed-off, and to confirm utility locations with alternate methods. All utility marks should be afforded an industry-standard tolerance zone of 24” to either side.
 - A known (or visible) point of connection is generally needed to identify the function of a utility.
 - A hand-dug or vacuum-excavated test hole should be used to precisely confirm horizontal or vertical location of any utility.

Equipment Capabilities

Ground–Penetrating Radar

- Principle of operation:
 - Ground-penetrating radar (GPR) uses a pair of radio antennas (transmitting and receiving), moved together across the ground surface. The transmitted radar wave penetrates into the ground until it reaches an “interface,” or boundary, between materials of differing electrical properties. The wave is then reflected and detected by the receiving antenna.
- Typical applications:
 - Non-conductive utilities
 - Plastic pipes, gas and water main/service, etc.
 - Bituminous fiber pipe (“Orangeburg,” “Bermico”), asbestos-cement pipe (“Transite”)
 - Cast iron pipe with rubber gaskets, or other insulating material
 - Subsurface structures
 - Buried tanks, cisterns, septic tanks, cesspools, dry wells, oil-water separators
 - Buried vaults, manholes, utility tunnels
 - Historical building foundations and other structures
 - Soil characteristics
 - Void spaces, sinkholes
 - Past excavations and disturbed soil
- Limitations:
 - For an object to produce a signal that is able to be interpreted by operators, the transmitted radar wave must penetrate to the depth of the object of interest, reflect, and return to the receiving antenna.
 - Depth of penetration is reduced by soils that are electrically conductive, due to water saturation or otherwise. Depth of penetration is reduced by especially rocky, mixed, or inconsistent soil. A metallic ground surface (i.e. steel plate), or standing water, interferes with penetration of transmitted signal into the soil.
 - A reflection of the radar signal depends on an “interface,” or boundary, of materials of differing electrical properties—such as that encountered at boundaries between soil layers of differing compaction, or at the surface of a hard object embedded in the soil. The reflection is weakened when the boundary has a lower contrast in electrical properties.
 - An object of a given diameter will produce a reflection of decreasing strength with increasing depth of cover. Generally, one inch of diameter is required, per foot of cover, to produce a strong reflection.
 - A known (or visible) point of connection is generally needed to identify the function of a utility.
 - Any utility, subsurface structure, or anomaly located with GPR and marked on site should be afforded an industry-standard tolerance zone of 24”.
 - A hand-dug or vacuum-excavated test hole should be used to precisely confirm horizontal or vertical location of any utility.

Description

On Point personnel worked on site to locate and mark consumer-owned utilities, and to clear proposed bore locations in the indicated work area. Methods used include both radio-frequency (RF) locating and ground-penetrating radar (GPR). Utilities located and marked include electric power, gas, steam, potable water, storm drainage, and unidentified utilities. A total of 10 bore locations were cleared. No utilities or anomalies were detected in the vicinity of bore locations SB-1, SB-7, and SB-9. Locations of utilities in the vicinity of the remaining bore locations are shown on the attached *Job Site Sketches*. Sketches are notated where bore locations in the field differed from those on drawings provided by AKRF, or where an alternate bore location was provided.

APPENDIX C
SOIL BORING LOGS

| SOIL BORING LOG | | Portions of the American Museum of Natural History and Theodore Roosevelt Park AKRF Project Number: 12166 | | Soil Boring ID: SB-1 Sheet 1 of 1 | | | | |
|---|-------------------|---|--|---|------------|---------------------------|------|------------------------------------|
|  440 Park Avenue South, 7th Floor New York, NY 10016 | | Drilling Method: 6610DT | | Drilling | | | | |
| | | Sampling Method: 2" Macro | | Start Time: 11:00 | | Finish Time: 11:40 | | |
| | | Driller: Cascade | | Date: 3/27/2017 | | | | |
| | | Weather: 45F, Light Rain | | | | | | |
| Logged By: M. Levy | | | | | | | | |
| Depth (feet) | Recovery (Inches) | Surface Condition: Landscape | | Odor | Moisture | PID (ppm) | NAPL | Samples Collected for Lab Analysis |
| 1 | 60 | Dark Brown SILT and SAND, with trace Roots (Top Soil). | | ND | Dry | ND | ND | SB-1 (1'-2') 170329 |
| 2 | | Brown SAND and SILT, with trace Brick and weathered rock. | | ND | Dry | ND | ND | |
| 3 | | Gray WEATHERED ROCK (SAND trace mica). | | | | | | |
| 4 | | | | | | | | |
| 5 | | | | | | | | |
| 6 | 60 | Brown SAND and SILT, with trace fine Gravel and weathered rock (gray and tan Sand w/ mica). | | ND | Dry | ND | ND | |
| 7 | | | | | | | | |
| 8 | | | | | | | | |
| 9 | | | | | | | | |
| 10 | | | | | | | | |
| 11 | 60 | Brown SAND and SILT, with trace fine Gravel and weathered rock (Gray and Tan Sand w/ mica). | | ND | Dry | 6.4 | ND | |
| 12 | | Gray WEATHERED ROCK (Sand with trace mica). | | ND | Dry | 7.1 | ND | |
| 13 | | ASPHALT. | | Asphalt | Dry | 12.2 | ND | |
| 14 | | | | | | | | |
| 15 | | | | | | | | |
| 16 | 60 | Brown SAND and SILT, with some tan and brown Sand, trace mica, weathered rock, trace fine gravel. | | ND | Wet at 18' | 7.4 | ND | SB-1 (17'-18') |
| 17 | | | | | | | | |
| 18 | | | | | | | | |
| 19 | | | | | | | | |
| 20 | | | | | | | | |
| 21 | 60 | Gray SAND and SILT. | | ND | Wet | ND | ND | |
| 22 | | Brown SAND and SILT. | | ND | Wet | ND | ND | |
| 23 | | Refusal at 24 feet below grade. | | | | | | |
| 24 | | | | | | | | |
| 25 | | | | | | | | |

Notes: End of boring at 24 feet below ground surface. Groundwater encountered at 18 feet below grade.

PID = photoionization detector PPM = parts per million ND = not detected

Sample ID: AA-170328
Canister ID: 5038
Flow Controller ID: 2763

Laboratory Sample (Summa Canister)

Time Started: 11:32 **Vacuum:** -30.0 inHg
Time Stopped: 12:32 **Vacuum:** -5.00 inHg

Potential VOC sources in vicinity: Vehicular Traffic.

APPENDIX F
TESTING LABORATORY ANALYTICAL DATA SHEETS

ANALYTICAL REPORT

Job Number: 460-130404-1

Job Description: American Museum of Natural History

For:
AKRF Inc
440 Park Avenue South
7th Floor
New York, NY 10016
Attention: Mr. Eric Park

Approved for release.
Allison L. Bennett
Project Management Assistant II
4/3/2017 4:06 PM

Designee for
Melissa Haas, Project Manager I
777 New Durham Road, Edison, NJ, 08817
(203)944-1310
melissa.haas@testamericainc.com
04/03/2017

The test results in this report meet all NELAP requirements unless specified within the case narrative. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. All questions regarding this report should be directed to the TestAmerica Edison Project Manager.

TestAmerica Edison Certifications and Approvals: Connecticut: CTDOH #PH-0200, New Jersey: NJDEP (NELAP) #12028, New York: NYDOH (NELAP) #11452, NYDOH (ELAP) #11452, Pennsylvania: PADEP (NELAP) 68-00522 and Rhode Island: RIDOH LAO00132

TestAmerica Laboratories, Inc.

TestAmerica Edison 777 New Durham Road, Edison, NJ 08817
Tel (732) 549-3900 Fax (732) 549-3679 www.testamericainc.com

Job Number: 460-130404-1

Job Description: American Museum of Natural History

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed within the body of this report. Release of the data contained in this sample data package and in the electronic data deliverable has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Approved for release.
Allison L. Bennett
Project Management Assistant II

CASE NARRATIVE

Client: AKRF Inc

Project: American Museum of Natural History

Report Number: 460-130404-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 3/27/2017 6:20 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.5° C.

Receipt Exceptions

The container label for the following samples did not match the information listed on the Chain-of-Custody (COC):

Sample ID on containers for sample #1 is SB-2 (0-2)-170327 not SB-2 (1-2)-170327 as recorded on the COC.

Sample ID on containers for sample #2 is SB-2 (7-9)-170327 not SB-2 (8-9)-170327 as recorded on the COC.

The client was contacted and instructed the lab to use the IDs on the COC.

Per laboratory policy, the Trip Blank sample date/time was changed to reflect the latest sample date/time of the sampling event.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples SB-2 (1-2)-170327 (460-130404-1), SB-2 (8-9)-170327 (460-130404-2), SB-4 (5-6)-170327 (460-130404-4), SB-4 (6-7)-170327 (460-130404-5), SB-3 (1-2)-170327 (460-130404-7) and SB-3 (5-6)-170327 (460-130404-8) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260C. The samples were prepared on 03/28/2017 and analyzed on 03/31/2017.

Acetone was detected in method blank MB 460-427321/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Acetone was detected in method blank MB 460-427483/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Acetone and m-Xylene & p-Xylene were detected in method blank LB3 460-426725/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Refer to the QC report for details.

No other difficulties were encountered during the volatiles analysis.

All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples GW-2-170327 (460-130404-3), GW-4-170327 (460-130404-6) and TB-170327 (460-130404-9) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 8260C. The samples were analyzed on 03/30/2017.

The continuing calibration verification (CCV) analyzed in batch 427072 was outside the method criteria for the following analytes: Chloroethane (biased high) and Bromoform (biased low). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

The laboratory control sample (LCS) for batch 427072 recovered outside control limits for the following analyte: Chloroethane. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Acetone was detected in method blank MB 460-427072/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

1,2,3-Trichlorobenzene and 1,2,4-Trichlorobenzene failed the recovery criteria low for the MS of sample 460-130538-19 in batch 460-427072. Chloroethane failed the recovery criteria high.

1,2,3-Trichlorobenzene and 1,2,4-Trichlorobenzene failed the recovery criteria low for the MSD of sample 460-130538-19 in batch 460-427072. Bromomethane failed the recovery criteria high.

Refer to the QC report for details.

No other difficulties were encountered during the volatiles analysis.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples SB-2 (1-2)-170327 (460-130404-1), SB-2 (8-9)-170327 (460-130404-2), SB-4 (5-6)-170327 (460-130404-4), SB-4 (6-7)-170327 (460-130404-5), SB-3 (1-2)-170327 (460-130404-7) and SB-3 (5-6)-170327 (460-130404-8) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 03/29/2017 and analyzed on 03/30/2017 and 03/31/2017.

The continuing calibration verification (CCV) analyzed in batch 460-427162 was outside the method criteria for the following analyte(s): 4-Methylphenol, 2,2'-oxybis[1-chloropropane], Pentachlorophenol and 4-Nitroaniline. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

The continuing calibration verification (CCV) analyzed in batch 460-427026 was outside the method criteria for the following analyte(s): Benzaldehyde, Phenol, Hexachlorocyclopentadiene and 2-Fluorophenol (Surr). A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

The continuing calibration verification (CCV) analyzed in batch 460-427031 was outside the method criteria for the following analyte(s): 4-Methylphenol, 2,4,6-Tribromophenol (Surr), 2,2'-oxybis[1-chloropropane] and 2-Nitroaniline. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

The continuing calibration verification (CCV) analyzed in batch 460-427323 was outside the method criteria for the following analyte(s): Di-n-butyl phthalate 2,2'-oxybis[1-chloropropane] Fluoranthene 4-Nitroaniline <AffectedAnalytes>. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for five analytes to recover outside criteria for this method when a full list spike is utilized. The LCS associated with batch 460-426922 had one analyte (4-Chloroaniline) outside control limits; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

Nitrobenzene failed the recovery criteria high for LCS 460-426926/2-A.

The following laboratory control sample (LCS) associated with batch 460-426922 contained one acid/base surrogate outside acceptance limits:(LCS 460-426922/3-A). The laboratory's SOP allows one acid and/or one base surrogate to be outside acceptance limits; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

The following laboratory control sample (LCS) associated with batch 460-426923 contained one acid/base surrogate outside acceptance limits:(LCS 460-426923/2-A). The laboratory's SOP allows one acid and/or one base surrogate to be outside acceptance limits; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

The following laboratory control sample (LCS) associated with batch 460-426923 contained one acid and one base surrogates outside acceptance limits:(LCS 460-426923/3-A). The laboratory's SOP allows one acid and one base of these surrogates to be outside acceptance limits; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

Nitrobenzene-d5 (Surr) and Phenol-d5 (Surr) failed the surrogate recovery criteria high for LCS 460-426926/2-A and LCS 460-426926/3-A.

Several analytes failed the recovery criteria low for the MS/MSD of sample SB-2 (1-2)-170327MS/MSD (460-130404-1) in batch 460-427026. 2-Chlorophenol, Bis(2-chloroethyl)ether and Phenol exceeded the RPD limit.

Several analytes failed the recovery criteria low for the MS/MSD of sample SB-4 (5-6)-170327MS/MSD (460-130404-4) in batch 460-427031. Pentachlorophenol exceeded the RPD limit.

Several analytes failed the recovery criteria low for the MS/MSD of sample SB-3 (1-2)-170327MS/MSD (460-130404-7) in batch 460-427323. Fluoranthene failed the recovery criteria high. Fluoranthene and Pyrene exceeded the RPD limit.

Refer to the QC report for details.

No other difficulties were encountered during the semivolatiles analysis.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC/MS)

Samples GW-2-170327 (460-130404-3) and GW-4-170327 (460-130404-6) were analyzed for semivolatile organic compounds (GC/MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 03/29/2017 and analyzed on 03/30/2017.

The continuing calibration verification (CCV) analyzed in batch 460-427021 was outside the method criteria for the following analyte(s): Indeno[1,2,3-cd]pyrene, Pyrene and 4-Nitroaniline. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Refer to the QC report for details.

No other difficulties were encountered during the semivolatiles analysis.

All quality control parameters were within the acceptance limits.

PESTICIDES

Samples SB-2 (1-2)-170327 (460-130404-1), SB-2 (8-9)-170327 (460-130404-2), SB-4 (5-6)-170327 (460-130404-4), SB-4 (6-7)-170327 (460-130404-5), SB-3 (1-2)-170327 (460-130404-7) and SB-3 (5-6)-170327 (460-130404-8) were analyzed for pesticides in accordance with EPA SW-846 Methods 8081B. The samples were prepared and analyzed on 03/29/2017.

Dieldrin failed the recovery criteria low for the MS of sample SB-2 (1-2)-170327MS (460-130404-1) in batch 460-426902.

Dieldrin exceeded the RPD limit for the MSD of sample SB-2 (1-2)-170327MSD (460-130404-1) in batch 460-426902.

Refer to the QC report for details.

No other difficulties were encountered during the pesticides analysis.

All other quality control parameters were within the acceptance limits.

PESTICIDES

Samples GW-2-170327 (460-130404-3) and GW-4-170327 (460-130404-6) were analyzed for pesticides in accordance with EPA SW-846 Methods 8081B. The samples were prepared on 03/29/2017 and analyzed on 03/30/2017.

No difficulties were encountered during the pesticides analysis.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS

Samples SB-2 (1-2)-170327 (460-130404-1), SB-2 (8-9)-170327 (460-130404-2), SB-4 (5-6)-170327 (460-130404-4), SB-4 (6-7)-170327 (460-130404-5), SB-3 (1-2)-170327 (460-130404-7) and SB-3 (5-6)-170327 (460-130404-8) were analyzed for polychlorinated biphenyls in accordance with EPA SW-846 Method 8082A. The samples were prepared and analyzed on 03/29/2017.

No difficulties were encountered during the PCBs analysis.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS

Samples GW-2-170327 (460-130404-3) and GW-4-170327 (460-130404-6) were analyzed for polychlorinated biphenyls in accordance with EPA SW-846 Method 8082A. The samples were prepared on 03/29/2017 and analyzed on 03/30/2017.

No difficulties were encountered during the PCBs analysis.

All quality control parameters were within the acceptance limits.

TOTAL METALS

Samples SB-2 (1-2)-170327 (460-130404-1), SB-2 (8-9)-170327 (460-130404-2), SB-4 (5-6)-170327 (460-130404-4), SB-4 (6-7)-170327 (460-130404-5), SB-3 (1-2)-170327 (460-130404-7) and SB-3 (5-6)-170327 (460-130404-8) were analyzed for total metals in accordance with EPA SW-846 Methods 6010C. The samples were prepared and analyzed on 03/30/2017.

The laboratory control sample (LCSSRM) for prep batch 427091 recovered outside control limits for the following analyte: Thallium. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Several analytes failed the recovery criteria low for the MS of sample SB-2 (1-2)-170327MS (460-130404-1) in batch 460-427224.

Arsenic, Copper, Iron, Lead and Manganese exceeded the RPD limit for the duplicate of sample SB-2 (1-2)-170327DU (460-130404-1).

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

Samples SB-2 (1-2)-170327 (460-130404-1)[4X], SB-2 (8-9)-170327 (460-130404-2)[4X], SB-4 (5-6)-170327 (460-130404-4)[4X], SB-4 (6-7)-170327 (460-130404-5)[4X], SB-3 (1-2)-170327 (460-130404-7)[4X] and SB-3 (5-6)-170327 (460-130404-8)[4X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the metals analysis.

All other quality control parameters were within the acceptance limits.

DISSOLVED METALS

Samples GW-2-170327 (460-130404-3) and GW-4-170327 (460-130404-6) were analyzed for dissolved metals in accordance with EPA SW-846 Method 6020A. The samples were prepared on 03/31/2017 and analyzed on 03/31/2017 and 04/01/2017.

Calcium and Sodium failed the recovery criteria low for the MS of sample GW-2-170327MS (460-130404-3) in batch 460-427617. Manganese failed the recovery criteria high.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the dissolved metals analysis.

All other quality control parameters were within the acceptance limits.

TOTAL METALS

Samples GW-2-170327 (460-130404-3) and GW-4-170327 (460-130404-6) were analyzed for total metals in accordance with EPA SW-846 Method 6020A. The samples were prepared and analyzed on 03/31/2017.

Calcium and Sodium failed the recovery criteria high for the MS of sample GW-4-170327MS (460-130404-6) in batch 460-427617.

Refer to the QC report for details.

No other difficulties were encountered during the metals analysis.

All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples SB-2 (1-2)-170327 (460-130404-1), SB-2 (8-9)-170327 (460-130404-2), SB-4 (5-6)-170327 (460-130404-4), SB-4 (6-7)-170327 (460-130404-5), SB-3 (1-2)-170327 (460-130404-7) and SB-3 (5-6)-170327 (460-130404-8) were analyzed for total mercury in accordance with EPA SW-846 Method 7471B. The samples were prepared and analyzed on 03/29/2017.

Mercury failed the recovery criteria low for the MS of sample 460-130440-3 in batch 460-426912.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the

spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the Hg analysis.

All other quality control parameters were within the acceptance limits.

DISSOLVED MERCURY

Samples GW-2-170327 (460-130404-3) and GW-4-170327 (460-130404-6) were analyzed for dissolved mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 03/30/2017.

No difficulties were encountered during the dissolved Hg analysis.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples GW-2-170327 (460-130404-3) and GW-4-170327 (460-130404-6) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 03/30/2017.

No difficulties were encountered during the Hg analysis.

All quality control parameters were within the acceptance limits.

PERCENT SOLIDS/PERCENT MOISTURE

Samples SB-2 (1-2)-170327 (460-130404-1), SB-2 (8-9)-170327 (460-130404-2), SB-4 (5-6)-170327 (460-130404-4), SB-4 (6-7)-170327 (460-130404-5), SB-3 (1-2)-170327 (460-130404-7) and SB-3 (5-6)-170327 (460-130404-8) were analyzed for percent solids/percent moisture in accordance with EPA Method CLPISM01.2 (Exhibit D) Modified. The samples were analyzed on 03/29/2017.

No difficulties were encountered during the %solids/moisture analysis.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: AKRF Inc

Job Number: 460-130404-1

| Lab Section | Qualifier | Description |
|----------------|-----------|---|
| GC/MS VOA | | |
| | U | Analyzed for but not detected. |
| | J | Indicates an estimated value. |
| | * | LCS or LCSD is outside acceptance limits. |
| | * | MS or MSD is outside acceptance limits. |
| | B | The analyte was found in an associated blank, as well as in the sample. |
| GC/MS Semi VOA | | |
| | U | Analyzed for but not detected. |
| | * | Duplicate RPD exceeds control limits |
| | J | Indicates an estimated value. |
| | * | LCS or LCSD is outside acceptance limits. |
| | * | MS or MSD is outside acceptance limits. |
| | * | Surrogate is outside acceptance limits. |
| GC Semi VOA | | |
| | U | Analyzed for but not detected. |
| | * | Duplicate RPD exceeds control limits |
| | * | MS or MSD is outside acceptance limits. |
| | p | The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported. |
| Metals | | |
| | * | Duplicate analysis not within control limits. |
| | U | Indicates analyzed for but not detected. |
| | 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |
| | J | Sample result is greater than the MDL but below the CRDL |
| | N | Spiked sample recovery is not within control limits. |

CASE NARRATIVE

Client: AKRF Inc

Project: American Museum of Natural History

Report Number: 460-130460-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 3/28/2017 5:40 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.5° C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

Acetone was detected in method blank MB 460-427237/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Acetone was detected in method blank MB 460-427517/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples SB-8(1-2)-170328 (460-130460-1), SB-8A(4.5-5.5)-170328 (460-130460-2), SB-5(1-2)-170328 (460-130460-3) and SB-5(4.5-5.5)-170328 (460-130460-4) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260C. The samples were prepared on 03/29/2017 and analyzed on 04/01/2017.

The continuing calibration verification (CCV) associated with batch 460-427517 recovered above the upper control limit for 1,1,2-Trichloro-1,2,2-trifluoroethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Acetone was detected in method blank LB3 460-426857/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Refer to the QC report for details.

No other difficulties were encountered during the volatiles analysis.

All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Sample GW-5-170328 (460-130460-5) was analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 8260C. The samples were analyzed on 03/31/2017.

The continuing calibration verification (CCV) associated with batch 460-427366 recovered above the upper control limit for Trichlorofluoromethane and 1,4-Dioxane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

The laboratory control sample duplicate (LCSD) for analytical batch 460-427366 recovered outside control limits for the following analyte: 1,4-Dioxane. This analyte was biased high in the LCSD and was not detected in the associated samples; therefore, the data have been

reported.

Refer to the QC report for details.

No other difficulties were encountered during the volatiles analysis.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples SB-8(1-2)-170328 (460-130460-1), SB-8A(4.5-5.5)-170328 (460-130460-2), SB-5(1-2)-170328 (460-130460-3) and SB-5(4.5-5.5)-170328 (460-130460-4) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 03/30/2017 and analyzed on 03/31/2017.

Several analytes failed the recovery criteria low for the MS/MSD of sample 460-130122-1 in batch 460-427310. Fluoranthene exceeded the RPD limit.

Refer to the QC report for details.

No other difficulties were encountered during the semivolatiles analysis.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC/MS)

Sample GW-5-170328 (460-130460-5) was analyzed for semivolatile organic compounds (GC/MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 03/29/2017 and analyzed on 03/30/2017.

The continuing calibration verification (CCV) analyzed in batch 460-427021 was outside the method criteria for the following analyte(s): Indeno[1,2,3-cd]pyrene, Pyrene and 4-Nitroaniline. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Refer to the QC report for details.

No other difficulties were encountered during the semivolatiles analysis.

All quality control parameters were within the acceptance limits.

PESTICIDES

Samples SB-8(1-2)-170328 (460-130460-1), SB-8A(4.5-5.5)-170328 (460-130460-2), SB-5(1-2)-170328 (460-130460-3) and SB-5(4.5-5.5)-170328 (460-130460-4) were analyzed for pesticides in accordance with EPA SW-846 Methods 8081B. The samples were prepared and analyzed on 03/31/2017.

No difficulties were encountered during the pesticides analysis.

All quality control parameters were within the acceptance limits.

PESTICIDES

Sample GW-5-170328 (460-130460-5) was analyzed for pesticides in accordance with EPA SW-846 Methods 8081B. The samples were prepared on 03/29/2017 and analyzed on 03/30/2017.

No difficulties were encountered during the pesticides analysis.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS

Samples SB-8(1-2)-170328 (460-130460-1), SB-8A(4.5-5.5)-170328 (460-130460-2), SB-5(1-2)-170328 (460-130460-3) and SB-5(4.5-5.5)-170328 (460-130460-4) were analyzed for polychlorinated biphenyls in accordance with EPA SW-846 Method 8082A. The samples were prepared and analyzed on 03/31/2017.

Aroclor 1016 failed the recovery criteria high for the MS/MSD of sample 460-130306-11 in batch 460-427376.

Refer to the QC report for details.

No other difficulties were encountered during the PCBs analysis.

All other quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS

Sample GW-5-170328 (460-130460-5) was analyzed for polychlorinated biphenyls in accordance with EPA SW-846 Method 8082A. The

samples were prepared on 03/29/2017 and analyzed on 03/30/2017.

No difficulties were encountered during the PCBs analysis.

All quality control parameters were within the acceptance limits.

METALS

Samples SB-8(1-2)-170328 (460-130460-1), SB-8A(4.5-5.5)-170328 (460-130460-2), SB-5(1-2)-170328 (460-130460-3) and SB-5(4.5-5.5)-170328 (460-130460-4) were analyzed for metals in accordance with EPA SW-846 Methods 6010C. The samples were prepared on 03/30/2017 and analyzed on 03/31/2017.

Antimony failed the recovery criteria low for the MS of sample SB-5(4.5-5.5)-170328MS (460-130460-4) in batch 460-427491. Aluminum, Iron and Potassium failed the recovery criteria high.

Antimony, Iron and Manganese failed the recovery criteria low for the MS of sample 460-130548-12 in batch 460-427449. Aluminum and Calcium failed the recovery criteria high.

Chromium exceeded the RPD limit for the duplicate of sample 460-130548-12.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

Samples SB-8(1-2)-170328 (460-130460-1)[4X], SB-8A(4.5-5.5)-170328 (460-130460-2)[4X], SB-5(1-2)-170328 (460-130460-3)[4X] and SB-5(4.5-5.5)-170328 (460-130460-4)[4X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the metals analysis.

All other quality control parameters were within the acceptance limits.

DISSOLVED METALS

Sample GW-5-170328 (460-130460-5) was analyzed for dissolved metals in accordance with EPA SW-846 Method 6020A. The samples were prepared on 04/04/2017 and analyzed on 04/04/2017 and 04/05/2017.

Several analytes failed the recovery criteria low for the MS of sample 460-130174-1 in batch 460-428349.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the dissolved metals analysis.

All other quality control parameters were within the acceptance limits.

TOTAL METALS

Sample GW-5-170328 (460-130460-5) was analyzed for total metals in accordance with EPA SW-846 Method 6020A. The samples were prepared on 03/31/2017 and analyzed on 04/02/2017 and 04/03/2017.

Calcium, Potassium and Sodium failed the recovery criteria low for the MS of sample 460-130527-2 in batch 460-427865.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the Metals analysis.

All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples SB-8(1-2)-170328 (460-130460-1), SB-8A(4.5-5.5)-170328 (460-130460-2), SB-5(1-2)-170328 (460-130460-3) and SB-5(4.5-5.5)-170328 (460-130460-4) were analyzed for total mercury in accordance with EPA SW-846 Method 7471B. The samples were prepared and analyzed on 03/30/2017.

No difficulties were encountered during the Hg analysis.

All quality control parameters were within the acceptance limits.

DISSOLVED MERCURY

Sample GW-5-170328 (460-130460-5) was analyzed for dissolved mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 03/29/2017.

No difficulties were encountered during the dissolved Hg analysis.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Sample GW-5-170328 (460-130460-5) was analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 03/30/2017.

No difficulties were encountered during the Hg analysis.

All quality control parameters were within the acceptance limits.

PERCENT SOLIDS/PERCENT MOISTURE

Samples SB-8(1-2)-170328 (460-130460-1), SB-8A(4.5-5.5)-170328 (460-130460-2), SB-5(1-2)-170328 (460-130460-3) and SB-5(4.5-5.5)-170328 (460-130460-4) were analyzed for percent solids/percent moisture in accordance with EPA Method CLPISM01.2 (Exhibit D) Modified. The samples were analyzed on 03/30/2017.

No difficulties were encountered during the %solids/moisture analysis.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: AKRF Inc

Job Number: 460-130460-1

| Lab Section | Qualifier | Description |
|----------------|-----------|---|
| GC/MS VOA | | |
| | U | Analyzed for but not detected. |
| | J | Indicates an estimated value. |
| | * | LCS or LCSD is outside acceptance limits. |
| | B | The analyte was found in an associated blank, as well as in the sample. |
| GC/MS Semi VOA | | |
| | U | Analyzed for but not detected. |
| | * | Duplicate RPD exceeds control limits |
| | J | Indicates an estimated value. |
| | * | MS or MSD is outside acceptance limits. |
| GC Semi VOA | | |
| | U | Analyzed for but not detected. |
| | * | MS or MSD is outside acceptance limits. |
| | p | The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported. |
| Metals | | |
| | * | Duplicate analysis not within control limits. |
| | U | Indicates analyzed for but not detected. |
| | 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |
| | J | Sample result is greater than the MDL but below the CRDL |
| | N | Spiked sample recovery is not within control limits. |

CASE NARRATIVE

Client: AKRF Inc

Project: American Museum of Natural History

Report Number: 460-130545-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 3/29/2017 6:40 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.5° C.

Receipt Exceptions

Soil vapor samples for TO-15 were included on this COC; however, the client was notified that TO-15 analysis is reported under a separate job number out of the TestAmerica Burlington lab. The soil vapor samples were shipped directly to TA Burlington and logged in separately from the soil and groundwater samples.

The following sample was canceled by the client on 04/06/17: GW-6-170329 (460-130545-3).

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples SB-6(0-1)-170329 (460-130545-1), SB-6(18-19)-170329 (460-130545-2), SB-1(1-2)-170329 (460-130545-4) and SB-1(17-18)-170329 (460-130545-5) were analyzed for Volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260C. The samples were prepared on 03/30/2017 and analyzed on 04/02/2017 and 04/03/2017.

Acetone was detected in method blank MB 460-427321/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Acetone was detected in method blank MB 460-427729/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Acetone was detected in method blank LB3 460-427077/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Refer to the QC report for details.

No other difficulties were encountered during the volatiles analysis.

All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Sample GW-1-170329 (460-130545-6) was analyzed for Volatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 8260C. The samples were analyzed on 04/04/2017.

The continuing calibration verification (CCV) associated with batch 460-428037 recovered above the upper control limit for 1,4-Dioxane. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported.

The laboratory control sample (LCS) analytical batch 460-428037 recovered outside control limits for the following analyte: 1,4-Dioxane. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

cis-1,2-Dichloroethene failed the recovery criteria low for the MS of sample 460-130244-1 in batch 460-428037. 2-Butanone (MEK) failed the recovery criteria high.

For the MSD of sample 460-130244-1 in batch 460-428037, cis-1,2-Dichloroethene failed the recovery criteria low. 1,4-Dioxane and 2-Butanone (MEK) failed the recovery criteria high. Also, 1,4-Dioxane exceeded the RPD limit.

Refer to the QC report for details.

No other difficulties were encountered during the volatiles analysis.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples SB-6(0-1)-170329 (460-130545-1), SB-6(18-19)-170329 (460-130545-2), SB-1(1-2)-170329 (460-130545-4) and SB-1(17-18)-170329 (460-130545-5) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 03/31/2017 and analyzed on 04/01/2017.

The continuing calibration verification (CCV) analyzed in batch 460-427556 was outside the method criteria for the following analyte(s): Acetophenone, 4-Nitrophenol, Diethyl phthalate, Isophorone, Bis(2-ethylhexyl) phthalate, Di-n-butyl phthalate, N-Nitrosodi-n-propylamine, 3-Nitroaniline, 2,4-Dinitrotoluene, 4-Nitroaniline and Di-n-octyl phthalate. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

The continuing calibration verification (CCV) analyzed in batch 460-427788 was outside the method criteria for the following analyte(s): 2,4-Dinitrophenol, 2,2'-oxybis[1-chloropropane] and 2-Nitroaniline. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Surrogates recoveries for the following laboratory control sample (LCS) associated with batch 460-427381 were outside limits. All spike recoveries were within limits. Sample has been qualified and reported.

2,4-Dinitrophenol, 2,4-Dinitrotoluene and 4,6-Dinitro-2-methylphenol failed the recovery criteria low for the MS of sample 460-130311-1 in batch 460-427556.

2,4-Dinitrophenol, 2,4-Dinitrotoluene and Diethyl phthalate failed the recovery criteria low for the MSD of sample 460-130311-1 in batch 460-427556.

Refer to the QC report for details.

No other difficulties were encountered during the semivolatiles analysis.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC/MS)

Sample GW-1-170329 (460-130545-6) was analyzed for semivolatile organic compounds (GC/MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 03/30/2017 and analyzed on 04/01/2017.

3,3'-Dichlorobenzidine, 3-Nitroaniline and 4-Nitroaniline failed the recovery criteria low for the MS of sample 460-130527-2 in batch 460-427561. Indeno[1,2,3-cd]pyrene failed the recovery criteria high.

3,3'-Dichlorobenzidine, 3-Nitroaniline and 4-Nitroaniline failed the recovery criteria low for the MSD of sample 460-130527-2 in batch 460-427561. Indeno[1,2,3-cd]pyrene failed the recovery criteria high.

Refer to the QC report for details.

No other difficulties were encountered during the semivolatiles analysis.

All other quality control parameters were within the acceptance limits.

PESTICIDES

Samples SB-6(0-1)-170329 (460-130545-1), SB-6(18-19)-170329 (460-130545-2), SB-1(1-2)-170329 (460-130545-4) and SB-1(17-18)-170329 (460-130545-5) were analyzed for Pesticides in accordance with EPA SW-846 Methods 8081B. The samples were prepared on 03/31/2017 and analyzed on 04/02/2017.

Endosulfan II, Endosulfan sulfate, Endrin aldehyde and Endrin ketone failed the recovery criteria low for the MS of sample 460-130588-12 in batch 460-428039. 4,4'-DDT failed the recovery criteria high.

Endosulfan II, Endosulfan sulfate, Endrin aldehyde and Endrin ketone failed the recovery criteria low for the MSD of sample 460-130588-12 in batch 460-428039. 4,4'-DDT failed the recovery criteria high.

Refer to the QC report for details.

No other difficulties were encountered during the Pesticides analysis.

All other quality control parameters were within the acceptance limits.

PESTICIDES

Sample GW-1-170329 (460-130545-6) was analyzed for Pesticides in accordance with EPA SW-846 Methods 8081B. The samples were prepared on 03/30/2017 and analyzed on 03/31/2017.

No difficulties were encountered during the pesticides analysis.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS

Samples SB-6(0-1)-170329 (460-130545-1), SB-6(18-19)-170329 (460-130545-2), SB-1(1-2)-170329 (460-130545-4) and SB-1(17-18)-170329 (460-130545-5) were analyzed for polychlorinated biphenyls in accordance with EPA SW-846 Method 8082A. The samples were prepared on 03/31/2017 and analyzed on 04/02/2017.

DCB Decachlorobiphenyl failed the surrogate recovery criteria high for SB-1(1-2)-170329 (460-130545-4).

Refer to the QC report for details.

No other difficulties were encountered during the PCBs analysis.

All other quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS

Sample GW-1-170329 (460-130545-6) was analyzed for polychlorinated biphenyls in accordance with EPA SW-846 Method 8082A. The samples were prepared on 03/30/2017 and analyzed on 03/31/2017.

No difficulties were encountered during the PCBs analysis.

All quality control parameters were within the acceptance limits.

METALS

Samples SB-6(0-1)-170329 (460-130545-1), SB-6(18-19)-170329 (460-130545-2), SB-1(1-2)-170329 (460-130545-4) and SB-1(17-18)-170329 (460-130545-5) were analyzed for Metals in accordance with EPA SW-846 Methods 6010C. The samples were prepared on 03/30/2017 and analyzed on 03/31/2017.

Iron failed the recovery criteria low for the MS of sample 460-130542-1 in batch 460-427477. Aluminum failed the recovery criteria high.

Antimony, Iron and Manganese failed the recovery criteria low for the MS of sample SB-6(0-1)-170329MS (460-130545-1) in batch 460-427491. Aluminum and Lead failed the recovery criteria high.

Copper exceeded the RPD limit for the duplicate of sample SB-6(0-1)-170329DU (460-130545-1).

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

Sample SB-6(0-1)-170329 (460-130545-1)[4X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the Metals analysis.

All other quality control parameters were within the acceptance limits.

DISSOLVED METALS

Sample GW-1-170329 (460-130545-6) was analyzed for Dissolved Metals in accordance with EPA SW-846 Method 6020A. The samples were prepared on 04/04/2017 and analyzed on 04/05/2017.

Several analytes failed the recovery criteria low for the MS of sample 460-130174-1 in batch 460-428349.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the total metals analysis.

All other quality control parameters were within the acceptance limits.

TOTAL METALS

Sample GW-1-170329 (460-130545-6) was analyzed for total metals in accordance with EPA SW-846 Method 6020A. The samples were prepared on 03/31/2017 and analyzed on 04/01/2017.

No difficulties were encountered during the metals analysis.

All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples SB-6(0-1)-170329 (460-130545-1), SB-6(18-19)-170329 (460-130545-2), SB-1(1-2)-170329 (460-130545-4) and SB-1(17-18)-170329 (460-130545-5) were analyzed for total mercury in accordance with EPA SW-846 Method 7471B. The samples were prepared and analyzed on 03/30/2017.

No difficulties were encountered during the Hg analysis.

All quality control parameters were within the acceptance limits.

DISSOLVED MERCURY

Sample GW-1-170329 (460-130545-6) was analyzed for dissolved mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 03/31/2017.

No difficulties were encountered during the dissolved Hg analysis.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Sample GW-1-170329 (460-130545-6) was analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 03/31/2017.

No difficulties were encountered during the Hg analysis.

All quality control parameters were within the acceptance limits.

PERCENT SOLIDS/PERCENT MOISTURE

Samples SB-6(0-1)-170329 (460-130545-1), SB-6(18-19)-170329 (460-130545-2), SB-1(1-2)-170329 (460-130545-4) and SB-1(17-18)-170329 (460-130545-5) were analyzed for percent solids/percent moisture in accordance with EPA Method CLPISM01.2 (Exhibit D) Modified. The samples were analyzed on 03/30/2017.

Percent Moisture exceeded the RPD limit for the duplicate of sample 460-130306-11.

Refer to the QC report for details.

No other difficulties were encountered during the %solids/moisture analysis.

All other quality control parameters were within the acceptance limits

DATA REPORTING QUALIFIERS

Client: AKRF Inc

Job Number: 460-130545-1

| Lab Section | Qualifier | Description |
|-------------------|-----------|---|
| GC/MS VOA | | |
| | U | Analyzed for but not detected. |
| | * | Duplicate RPD exceeds control limits |
| | J | Indicates an estimated value. |
| | * | LCS or LCSD is outside acceptance limits. |
| | * | MS or MSD is outside acceptance limits. |
| | B | The analyte was found in an associated blank, as well as in the sample. |
| GC/MS Semi VOA | | |
| | U | Analyzed for but not detected. |
| | J | Indicates an estimated value. |
| | * | MS or MSD is outside acceptance limits. |
| | * | Surrogate is outside acceptance limits. |
| GC Semi VOA | | |
| | U | Analyzed for but not detected. |
| | * | MS or MSD is outside acceptance limits. |
| | * | Surrogate is outside acceptance limits. |
| Metals | | |
| | * | Duplicate analysis not within control limits. |
| | U | Indicates analyzed for but not detected. |
| | 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |
| | J | Sample result is greater than the MDL but below the CRDL |
| | N | Spiked sample recovery is not within control limits. |
| General Chemistry | | |
| | * | Duplicate analysis not within control limits. |

| Question | Answer | Comment |
|--|--------|---|
| Radioactivity wasn't checked or is <=/ background as measured by a survey meter. | N/A | |
| The cooler's custody seal, if present, is intact. | N/A | Not present |
| Sample custody seals, if present, are intact. | N/A | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | 2.5°C, IR #8 |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | N/A | No analysis requiring residual chlorine check assigned. |

ANALYTICAL REPORT

Job Number: 460-130646-1

Job Description: American Museum of Natural History

For:
AKRF Inc
440 Park Avenue South
7th Floor
New York, NY 10016
Attention: Mr. Eric Park

Approved for release.
Allison L. Bennett
Project Management Assistant II

CASE NARRATIVE

Client: AKRF Inc

Project: American Museum of Natural History

Report Number: 460-130646-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 3/30/2017 6:50 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.4° C.

Receipt Exceptions

Per laboratory policy, the Trip Blank sample date/time was changed to reflect the latest sample date/time of the sampling event.

A trip blank was submitted for analysis with these samples; however, it was not listed on the Chain of Custody (COC). 2 vials received. The client was notified that the sample was activated for analysis.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples SB-7 (1-2)-170330 (460-130646-1), SB-7 (18.5-19.5)-170330 (460-130646-2), SB-10 (2-3)-170330 (460-130646-4) and SB-9 (2-3)-170330 (460-130646-5) were analyzed for Volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260C. The samples were prepared on 03/31/2017 and analyzed on 04/04/2017.

Acetone was detected in method blank MB 460-427946/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Acetone was detected in method blank MB 460-428019/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

1,1,2-Trichloro-1,2,2-trifluoroethane was detected in method blank LB3 460-427346/1-A at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Acetone was detected in method blank LB3 460-427346/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Refer to the QC report for details.

No other difficulties were encountered during the volatiles analysis.

All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples GW-7-170330 (460-130646-3) and Trip Blank (460-130646-6) were analyzed for Volatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 8260C. The samples were analyzed on 04/05/2017.

The continuing calibration verification (CCV) analyzed in batch 460-428182 was outside the method criteria for the following analyte(s): Bromoform and 1,2,3-Trichlorobenzene. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Refer to the QC report for details.

No other difficulties were encountered during the volatiles analysis.

All quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples SB-7 (1-2)-170330 (460-130646-1), SB-7 (18.5-19.5)-170330 (460-130646-2), SB-10 (2-3)-170330 (460-130646-4) and SB-9 (2-3)-170330 (460-130646-5) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 04/02/2017 and analyzed on 04/03/2017.

Nitrobenzene-d5 (Surr) and Phenol-d5 (Surr) failed the surrogate recovery criteria high for LCS 460-427681/2-A.

Nitrobenzene-d5 (Surr) failed the surrogate recovery criteria high for LCS 460-427681/3-A.

Isophorone and N-Nitrosodi-n-propylamine failed the recovery criteria high for LCS 460-427681/2-A.

2,4,6-Tribromophenol (Surr) failed the surrogate recovery criteria low for 460-130644-E-14-A MS.

2,4,6-Tribromophenol (Surr) failed the surrogate recovery criteria low for 460-130644-E-14-B MSD.

Several analytes failed the recovery criteria low for the MS of sample 460-130644-14 in batch 460-427760. Fluoranthene and Phenanthrene failed the recovery criteria high.

For the MSD of sample 460-130644-14 in batch 460-427760, Several analytes failed the recovery criteria low. Several analytes failed the recovery criteria high. Also, Fluoranthene and Phenanthrene exceeded the RPD limit.

Refer to the QC report for details.

No other difficulties were encountered during the semivolatiles analysis.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC/MS)

Sample GW-7-170330 (460-130646-3) was analyzed for semivolatile organic compounds (GC/MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 03/31/2017 and analyzed on 04/03/2017.

A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for five analytes to recover outside criteria for this method when a full list spike is utilized. The LCS associated with batch 460-427482 had three analytes (Chrysene, Benzo[a]anthracene and Dibenzofuran) outside control limits; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

3,3'-Dichlorobenzidine, Benzo[b]fluoranthene and Bis(2-chloroethyl)ether failed the recovery criteria low for the MS of sample 460-130598-3 in batch 460-427527.

3,3'-Dichlorobenzidine failed the recovery criteria low for the MSD of sample 460-130598-3 in batch 460-427527. 3,3'-Dichlorobenzidine exceeded the RPD limit.

Refer to the QC report for details.

No other difficulties were encountered during the semivolatiles analysis.

All other quality control parameters were within the acceptance limits.

PESTICIDES

Samples SB-7 (1-2)-170330 (460-130646-1), SB-7 (18.5-19.5)-170330 (460-130646-2), SB-10 (2-3)-170330 (460-130646-4) and SB-9 (2-3)-170330 (460-130646-5) were analyzed for Pesticides in accordance with EPA SW-846 Methods 8081B. The samples were prepared on 03/31/2017 and analyzed on 04/02/2017 and 04/03/2017.

The DCB Decachlorobiphenyl surrogate recovery for the following samples was outside acceptance limits (high biased) on the confirmation column due to matrix interference: SB-7 (1-2)-170330 (460-130646-1) and SB-10 (2-3)-170330 (460-130646-4). The recovery is within acceptance limits on the other column, indicating that the extraction process was in control.

Endrin aldehyde failed the recovery criteria low for the MS/MSD of sample 460-130621-6 in batch 460-427686.

Refer to the QC report for details.

No other difficulties were encountered during the Pesticides analysis.

All other quality control parameters were within the acceptance limits.

PESTICIDES

Sample GW-7-170330 (460-130646-3) was analyzed for Pesticides in accordance with EPA SW-846 Methods 8081B. The samples were prepared on 04/03/2017 and analyzed on 04/05/2017.

No difficulties were encountered during the pesticides analysis.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS

Samples SB-7 (1-2)-170330 (460-130646-1), SB-7 (18.5-19.5)-170330 (460-130646-2), SB-10 (2-3)-170330 (460-130646-4) and SB-9 (2-3)-170330 (460-130646-5) were analyzed for polychlorinated biphenyls in accordance with EPA SW-846 Method 8082A. The samples were prepared on 03/31/2017 and analyzed on 04/02/2017 and 04/03/2017.

No difficulties were encountered during the PCBs analysis.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS

Sample GW-7-170330 (460-130646-3) was analyzed for polychlorinated biphenyls in accordance with EPA SW-846 Method 8082A. The samples were prepared and analyzed on 04/03/2017.

No difficulties were encountered during the PCBs analysis.

All quality control parameters were within the acceptance limits.

METALS

Samples SB-7 (1-2)-170330 (460-130646-1), SB-7 (18.5-19.5)-170330 (460-130646-2), SB-10 (2-3)-170330 (460-130646-4) and SB-9 (2-3)-170330 (460-130646-5) were analyzed for Metals in accordance with EPA SW-846 Methods 6010C. The samples were prepared on 04/01/2017 and analyzed on 04/02/2017.

Antimony failed the recovery criteria low for the MS of sample 460-130644-12 in batch 460-427721. Several analytes failed the recovery criteria high.

Copper exceeded the RPD limit for the duplicate of sample 460-130644-12.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

Samples SB-7 (1-2)-170330 (460-130646-1)[4X], SB-7 (18.5-19.5)-170330 (460-130646-2)[4X], SB-10 (2-3)-170330 (460-130646-4)[4X] and SB-9 (2-3)-170330 (460-130646-5)[4X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the Metals analysis.

All other quality control parameters were within the acceptance limits.

DISSOLVED METALS

Sample GW-7-170330 (460-130646-3) was analyzed for dissolved metals in accordance with EPA SW-846 Method 6020A. The samples were prepared and analyzed on 04/05/2017.

Sodium failed the recovery criteria low for the MS of sample 460-130507-10 in batch 460-428431.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the dissolved metals analysis.

All other quality control parameters were within the acceptance limits.

TOTAL METALS

Sample GW-7-170330 (460-130646-3) was analyzed for total metals in accordance with EPA SW-846 Method 6020A. The samples were prepared on 04/02/2017 and analyzed on 04/03/2017.

No difficulties were encountered during the Metals analysis.

All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples SB-7 (1-2)-170330 (460-130646-1), SB-7 (18.5-19.5)-170330 (460-130646-2), SB-10 (2-3)-170330 (460-130646-4) and SB-9 (2-3)-170330 (460-130646-5) were analyzed for total mercury in accordance with EPA SW-846 Method 7471B. The samples were prepared and analyzed on 04/03/2017.

No difficulties were encountered during the Hg analysis.

All quality control parameters were within the acceptance limits.

DISSOLVED MERCURY

Sample GW-7-170330 (460-130646-3) was analyzed for dissolved mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 03/31/2017.

No difficulties were encountered during the dissolved Hg analysis.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Sample GW-7-170330 (460-130646-3) was analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 04/03/2017.

No difficulties were encountered during the Hg analysis.

All quality control parameters were within the acceptance limits.

PERCENT SOLIDS/PERCENT MOISTURE

Samples SB-7 (1-2)-170330 (460-130646-1), SB-7 (18.5-19.5)-170330 (460-130646-2), SB-10 (2-3)-170330 (460-130646-4) and SB-9 (2-3)-170330 (460-130646-5) were analyzed for percent solids/percent moisture in accordance with EPA Method CLPISM01.2 (Exhibit D) Modified. The samples were analyzed on 04/04/2017.

No difficulties were encountered during the %solids/moisture analysis.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: AKRF Inc

Job Number: 460-130646-1

| Lab Section | Qualifier | Description |
|----------------|-----------|---|
| GC/MS VOA | | |
| | U | Analyzed for but not detected. |
| | J | Indicates an estimated value. |
| | B | The analyte was found in an associated blank, as well as in the sample. |
| GC/MS Semi VOA | | |
| | U | Analyzed for but not detected. |
| | * | Duplicate RPD exceeds control limits |
| | J | Indicates an estimated value. |
| | * | LCS or LCSD is outside acceptance limits. |
| | * | MS or MSD is outside acceptance limits. |
| | * | Surrogate is outside acceptance limits. |
| GC Semi VOA | | |
| | U | Analyzed for but not detected. |
| | E | Compound concentration exceeds the upper level of the calibration range of the instrument for that specific analysis. |
| | * | MS or MSD is outside acceptance limits. |
| | * | Surrogate is outside acceptance limits. |
| | p | The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported. |
| Metals | | |
| | * | Duplicate analysis not within control limits. |
| | U | Indicates analyzed for but not detected. |
| | 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |
| | J | Sample result is greater than the MDL but below the CRDL |
| | N | Spiked sample recovery is not within control limits. |

| Question | Answer | Comment |
|--|--------|---|
| Radioactivity wasn't checked or is \leq background as measured by a survey meter. | N/A | |
| The cooler's custody seal, if present, is intact. | N/A | Not present |
| Sample custody seals, if present, are intact. | N/A | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | 2.4°C IR#8 |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | False | See NCM |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4"). | True | |
| Multiphasic samples are not present. | N/A | |
| Samples do not require splitting or compositing. | N/A | |
| Residual Chlorine Checked. | N/A | No analysis requiring residual chlorine check assigned. |

ANALYTICAL REPORT

Job Number: 200-38004-1

SDG Number: 200-38004-1

Job Description: American Museum of Natural History

For:
AKRF Inc
440 Park Avenue South
7th Floor
New York, NY 10016
Attention: Mr. Eric Park

Kristine Dusablon

Approved for release.
Kristine A Dusablon
Project Manager II

CASE NARRATIVE

Client: AKRF Inc

Project: American Museum of Natural History

Report Number: 200-38004-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 03/30/2017; the samples arrived in good condition.

VOLATILE ORGANIC COMPOUNDS

Samples AA-170328, SV-2-170328, SV-4-170328 and SV-5-170328 were analyzed for Volatile Organic Compounds in accordance with EPA Method TO-15. The samples were analyzed on 04/04/2017.

Samples SV-2-170328[4X], SV-4-170328[6.06X] and SV-5-170328[2X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

| Question | Answer | Comment |
|--|--------|--|
| Radioactivity wasn't checked or is \leq background as measured by a survey meter. | True | Lab does not accept radioactive samples. |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | N/A | Thermal preservation not required. |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | N/A | Thermal preservation not required. |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | False | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | N/A | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | N/A | |

ANALYTICAL REPORT

CASE NARRATIVE

Client: AKRF Inc

Project: American Museum of Natural History

Report Number: 200-38009-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 03/30/2017; the samples arrived in good condition.

For all samples, the chain of custody (COC) identifies the sample dates and times, while the sample ID tags do not have sample dates and times recorded. The samples were logged in using the COC for all sample information.

VOLATILE ORGANIC COMPOUNDS

Samples SV-6-170329, SV-1-170329, SV-3-170329 and TB-170329 were analyzed for Volatile Organic Compounds in accordance with EPA Method TO-15. The samples were analyzed on 04/04/2017.

Samples SV-6-170329[6.06X], SV-1-170329[5X] and SV-3-170329[4X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

| Question | Answer | Comment |
|--|--------|--|
| Radioactivity wasn't checked or is \leq background as measured by a survey meter. | True | Lab does not accept radioactive samples. |
| The cooler's custody seal, if present, is intact. | True | Not present |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | N/A | Thermal preservation not required. |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | N/A | Thermal preservation not required. |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | False | Refer to Job Narrative for details. |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | N/A | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | N/A | |

ANALYTICAL REPORT

Job Number: 200-38067-1

SDG Number: 200-38067-1

Job Description: American Museum of Natural History

For:
AKRF Inc
440 Park Avenue South
7th Floor
New York, NY 10016
Attention: Mr. Eric Park

Kristine Dusablon

Approved for release.

CASE NARRATIVE

Client: AKRF Inc

Project: American Museum of Natural History

Report Number: 200-38067-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 04/03/2017; the samples arrived in good condition.

VOLATILE ORGANIC COMPOUNDS

Sample SV-7-170330 was analyzed for Volatile Organic Compounds in accordance with EPA Method TO-15. The samples were analyzed on 04/12/2017 and 04/13/2017.

Samples SV-7-170330[9.89X] and SV-7-170330[98.9X] required dilution prior to analysis. The reporting limits have been adjusted accordingly. Both sets of results are reported in the data package submittal.

The continuing calibration verification (CCV) associated with batch 200-115748 recovered above the upper control limit for 1,2,4-Trichlorobenzene, Hexachlorobutadiene and Naphthalene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

The laboratory control sample (LCS) for analytical batch 200-115748 recovered outside control limits for the 1,2,4-Trichlorobenzene, Hexachlorobutadiene and Naphthalene. These analytes were biased high in the LCS and were not detected in the associated sample; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

EXECUTIVE SUMMARY - Detections

DATA REPORTING QUALIFIERS

Client: AKRF Inc

Job Number: 200-38067-1

Sdg Number: 200-38067-1

| Lab Section | Qualifier | Description |
|--------------------|------------------|---|
| Air - GC/MS VOA | J | Indicates an Estimated Value for TICs |
| | U | Indicates the analyte was analyzed for but not detected. |
| | * | LCS or LCSD is outside acceptance limits. |
| | E | Result exceeded calibration range. |
| | D | Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples. |

APPENDICES

Appendix A – Construction Health and Safety Plan

1.0 INTRODUCTION

This Remedial Action Plan (RAP) was prepared for the proposed Gilder Center project at the American Museum of Natural History (AMNH or the Museum) in Theodore Roosevelt Park. The proposed project comprises construction of the Gilder Center, which entails partial or full demolition of portions of the Museum including Sections 1, 7A, 8, 11, 11A, 11B, 15, 15A, 16, and 17, Weston Pavilion, the new location of The New York Times Capsule, and adjacent Museum yards, along with improvements to an approximately 75,000-square foot (SF) portion of Theodore Roosevelt Park and adjacent areas during construction of the proposed project (collectively, and as shown on Figure 1, as the “Remedial Action Plan Site” or “RAP Site”). The RAP Site, along with the remainder of the Museum buildings and grounds, are located at 200 Central Park West, on New York City-owned mapped parkland under the jurisdiction of the New York City Department of Parks and Recreation (NYC Parks) and defined legally as Tax Block 1130, part of Lot 1, as shown on Figure 1.

The RAP is based upon the findings of a *Phase I Environmental Site Assessment* [AKRF, Inc. (AKRF), November 2016] and a *Subsurface (Phase II) Investigation* (AKRF, April 2017, Updated July 2017). The purpose of this RAP is to present procedures for managing on-site and off-site activities related to on-site subsurface disturbance work associated with the proposed project. This RAP requires all such activities to be conducted in accordance with applicable federal, state, and local requirements, including guidelines for environmental mitigation measures, such as pre-construction ACM surveys, soil stockpiling, soil disposal and transportation; dust control; contingency measures if additional petroleum storage tanks or other contamination should be unexpectedly encountered; and a minimum two foot clean fill buffer in any landscaped or uncapped areas, designed to control or avoid the potential for human or environmental exposure to known or unexpectedly encountered hazardous materials during and following construction of the proposed project.

Areas where on-site subsurface disturbance work, related construction activities, and related construction mitigation measures will occur are referred to as remedial construction areas. Portions of the RAP Site outside of remedial construction areas where certain construction mitigation measures described in this RAP may be implemented, such as community air monitoring and some storm-water pollution prevention measures, will be referred to as auxiliary monitoring areas. Other portions of the RAP Site outside of both the remedial construction areas, and auxiliary monitoring areas may not require any mitigation measures based upon the proposed project-related work, and the proximity of the area relative to remedial construction areas and auxiliary monitoring areas. The boundaries and locations of the remedial construction areas, auxiliary monitoring areas, and other portions of the RAP Site will change throughout the duration of the proposed project work based upon the locations of construction work areas. The applicable construction mitigation measure logistics will be reevaluated throughout the duration of the proposed project work to reflect the changing work area boundaries.

All work outlined within this RAP is also subject to the *Construction Phase Environmental Health and Safety Plan* (CHASP) developed for the proposed project, which is provided as Appendix A. The RAP and CHASP will be reviewed and approved by the New York City Department of Environmental Protection (NYCDEP) and on-site work related to the proposed project will be consistent with the approved RAP and CHASP.

2.0 SITE BACKGROUND

2.1 Site Characterization

Based on U.S. Geological Survey mapping, the Museum lies at an elevation of approximately +85 to +90 feet above the North American Vertical Datum (NAVD) of 1988 (an approximation of mean sea level), with the ground within the landscaped area sloping down to the east. The

Yard was observed to be approximately 13.5 to 14.5 feet lower than the landscaped area, isolated from landscaped areas by retaining walls in the northern portion of the Yard or Museum buildings and sloped driveways to the south. For the purposes of this report, all depths to subsurface findings, including soil types, bedrock, and groundwater will be presented as existing grade relative to the landscaped area.

Based on USGS mapping, depth to bedrock in the vicinity of the Museum is anticipated to be highly variable (approximately 5 to 35 feet below existing grade relative to the landscaped area). During the Phase II investigation, evidence of weathered bedrock was observed as shallow as 2 to 3 feet below existing grade (relative to the landscaped area).

Groundwater was observed between approximately 18 and 23 feet below existing grade (relative to the landscaped area); which, based on the presence of shallow weathered bedrock, is likely to be attributed to a perched water table. Though the local topography may indicate that groundwater at the Museum might flow towards the east, groundwater in the greater area surrounding the Museum is anticipated to flow in a southwesterly direction toward the Hudson River, approximately 3,200 feet west of the Museum. Actual groundwater depth and flow beneath the Museum can be affected by many factors, including bedrock geology, the A/B/C/D Line subway tunnels approximately 450 feet east of the Museum (east-adjacent to the Museum superblock beneath Central Park West), other subsurface features or obstructions such as basements or utilities, and other factors. Groundwater in Manhattan is not used as a source of potable water.

2.2 Previous Environmental Investigations

American Museum of Natural History – Portions of the American Museum of Natural History and Theodore Roosevelt Park, New York, New York - Phase I ESA, AKRF, November 2016

The Phase I ESA reviewed a variety of sources including: current and historical land use maps; state and federal environmental regulatory databases; computerized New York City Fire Department (FDNY), and Buildings Department records; and previous studies, and included reconnaissance of the Phase I Site and its surroundings.

The Phase I Site buildings were constructed between 1902 and 2000 as parts of Museum expansions, and have been used as historically as exhibition, research, educational, and maintenance purposes associated with the Museum.

The Phase I ESA identified the following Recognized Environmental Conditions (RECs):

- Historical petroleum and chemical storage and use at the Phase I Site that might represent RECs included:

Section 16 – One 1,080-gallon diesel aboveground storage tank (AST) located within an epoxy-coated room with secondary containment berm (i.e., a low concrete berm constructed around the perimeter of the tank);

Section 17 – One empty 250-gallon parts washer tank formerly containing trichloroethylene (TCE) (which was formerly used to remove lipids and fats from vertebrate zoology specimens), and a 500-gallon double-walled diesel AST located on the first floor (a day tank associated with the AST located in Section 16); and

Exterior yard – Approximately 17 drums (up to 55 gallons) of ethanol, isopropanol, research space waste, and diesel in secured chemical storage sheds. Chemical storage sheds included secondary containment systems, and were regularly inspected to prevent spillage. Floor drains noted in the exterior yard and other areas throughout the Phase I Site were reported to

be connected to the municipal sewer system and were in good condition with no evidence of releases or spills. Spill prevention kits were also identified in the drum storage area.

Regulatory databases identified the Museum as a small quantity generator (SQG) of hazardous waste from 2005 to 2016, and historical large quantity generator (LQG) of hazardous waste from 1984 to 2005. Chemical waste was disposed of by Clean Harbors, a permitted chemical waste hauler. The chemical storage areas are New York City Fire Department (FDNY)-permitted, with no evidence of a release noted on or concerning the Phase I Site.

- The Museum was registered in the New York State Department of Environmental Conservation (NYSDEC) Petroleum Bulk Storage (PBS) database with four ASTs and two underground storage tanks (USTs). Of these, two ASTs and one UST were located at the Phase I Site. These included: the two diesel ASTs discussed above; one closed-in-place 1,080-gallon double-wall steel UST with interstitial monitoring and high-level alarm in the exterior yard; and a former 50-gallon AST in Section 1, which was associated with the 1,080-gallon UST. The 50-gallon AST was registered with NYSDEC as being in-service, but was removed in September 2016. The on-site storage tanks were registered as having spill prevention measures including secondary containment in the form of curbs or double-wall construction, interstitial alarms, and high-level alarms, and no evidence of a release on or near the Phase I Site was noted.
- Other historical uses of the Phase I Site included use of Section 17 (the Power House) as a coal-fired electric power plant, and Section 15 as an auto house (i.e., garage) and power house. During the reconnaissance, no evidence of coal storage or residue was observed and there is, therefore, no present information indicating that the proposed project is expected to be complicated by the former presence of the power house and auto house.

The Phase I ESA also identified the following *de minimis* conditions:

- Arsenic-preserved hides were stored in dedicated areas on the fifth floor of Section 1, and on the third floor of Section 7A. Arsenic preservation was a common preservation technique for natural history collections between approximately 1930 and 1990. Preserved hides were stored in designated cabinets.
- Chemical storage in Section 8 was noted on the fifth floor in a FDNY-permitted room with a secondary containment berm. Chemicals stored included 1-butanol, ethyl alcohol, toluene, and other specimen preservation-related solvents in containers up to five gallons, with no record of historic release.
- Chemical storage in Section 11B was noted on the lower level and fourth floors and included nitrate film negatives and acetate film roll storage.
- Chemical storage noted in Section 15 in the Ichthyology collections included approximately 300,000 small jars (up to five gallons) of specimens preserved in ethanol or isopropanol, large containers and drums (up to 55 gallons) of ethanol used for specimen preservation, and other containers (generally 15 gallons or less) of organic solvents and solvent wastes, with no record of historic release.
- Chemical storage noted in Section 17 included small containers (up to one gallon) of polyester resins, spray paints, and acids in the exhibition production shop on the fifth floor.

- In addition to the chemical storage noted above, the exterior yard was used to store 55-gallon drums of waste cooking oil, and liquid nitrogen in a 3,000-gallon AST, with no record of historic release.
- A proposed 30,000-gallon UST was shown on 1962 engineering plans for Section 17 (the Power House). However, no documentation of the UST installation was found. Museum representatives did not believe the tank was installed, and the Museum was reported to have converted from coal to Consolidated Edison steam as a heating source around the time the plans were prepared; thus, it appears the proposed UST was never installed.
- One closed-in-place 1,080-gallon double-wall UST with spill/fill containment, interstitial monitoring, and a high-level alarm was identified in the exterior yard. This UST was associated with the former 50-gallon day tank AST identified in Section 1.
- The following petroleum storage tanks were located in Museum areas outside of the Phase I Site boundary: one in-service 6,000-gallon double-wall fiberglass reinforced plastic UST and one in-service 200-gallon AST, both containing diesel fuel for supplying an emergency generator. These tanks were located in a courtyard in the southwestern portion of the Museum (outside of the Phase I Site boundary). No odors, staining, or spills were noted in the vicinity of the AST, and no related historical spills were documented.
- Based on the age of the Museum sections and prior subsurface investigations which identified historic fill in the northern portion of Theodore Roosevelt Park, historic fill materials may also be present beneath the Phase I Site. Historic fill material was investigated further as part of the Subsurface (Phase II) Investigation.

Geophysical Survey, American Museum of Natural History, Hager-Richter Geoscience, Inc., March 2017

Hager-Richter Geoscience, Inc. completed a Geophysical Survey related to a geotechnical investigation lead by Langan in February 2017. The objective of the survey was to detect on-site utilities within the proposed redevelopment area.

- Segments of known electrical and sewer utilities, a known utility trench and small segments of possible utilities were detected. No major unknown utilities or anomalies were detected during the geophysical survey.

American Museum of Natural History – Portions of the American Museum of Natural History and Theodore Roosevelt Park, New York, New York – Phase II Subsurface Investigation, AKRF, June 2017

The scope of the Phase II investigation was established in AKRF's Subsurface (Phase II) Investigation Sampling Protocol and Health and Safety Plan, dated February 2017, based on the findings of AKRF's November 2016 Phase I ESA. On February 27, 2017, NYCDEP issued an approval letter for the Subsurface (Phase II) Investigation Sampling Protocol and Health and Safety Plan.

The Phase II field activities were conducted between March 23 and 30, 2017, and included a geophysical survey, and the advancement of soil borings with the collection and laboratory analysis of soil, groundwater, and soil vapor samples. Soil sample laboratory analytical results were compared to the NYSDEC 6 New York Codes, Rules, and Regulations (NYCRR) Part 375 Soil Cleanup Objectives (SCOs) for Restricted Residential use (RRSCOs) and Commercial use (CSCOs). Groundwater sample laboratory analytical results were compared to the NYSDEC Technical and Operational Guidance Series (1.1.1): Class GA Ambient Water Quality Standards and Guidance Values (AWQS), including Type E aesthetic standards for protection of

freshwaters. Soil vapor laboratory analytical results were compared to the New York State Department of Health (NYSDOH) Air Guidance Values (AGVs) for indoor air quality of the Final Guidance for Evaluation Soil Vapor Intrusion in the State of New York, dated October 2006, as revised in the September 2013, and August 2015 fact sheets for tetrachloroethylene (PCE) and TCE.

The following findings were identified as part of the Phase II Investigation:

- The geophysical survey did not identify subsurface anomalies to indicate the presence of undocumented USTs.
- Brown fine sand and silt, with some clay was observed from grade surface to the terminus of each boring (between 18 and 25 feet below existing grade relative to the landscaped area). Weathered bedrock was interspersed throughout the sand and silt layer, starting as shallow as 2 feet below existing grade (relative to the grade of the landscaped area).
- During field screening of soil samples, photoionization detector (PID) readings ranging from approximately 1 to 12 parts per million (ppm) were noted in three soil borings. Soil samples were biased toward intervals with PID detections. No petroleum-like odors, sheens, staining, or other potential signs of soil contamination were observed during the Phase II investigation.
- No volatile organic compounds (VOCs) were detected in soil samples above their respective NYSDEC Part 375 RRSCOs or CSCOs. A trace TCE detection was identified at one location at a depth between 0 and 1 foot below grade. TCE was not detected in any other soil samples. These findings are not indicative of on-site TCE contamination of significance.
- Multiple semivolatile organic compounds (SVOCs), primarily comprising polycyclic aromatic hydrocarbons (PAHs), were detected in 14 of 18 soil samples. Benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene were detected at concentrations above their respective RRSCOs in soil sample SB-1(1-2)-170329, with the benzo(a)pyrene detection above the CSCO as well. The exceedances were not significantly above the RRSCOs and CSCOs and were at concentrations typical of soil at many urban sites, including throughout Manhattan. These detections will be addressed by the provisions specified in this RAP.
- No metals, polychlorinated biphenyls (PCBs), or pesticides were detected in soil samples above their respective RRSCOs and CSCOs. Metals detections were at concentrations typical of soil at many urban sites, including throughout Manhattan. Pesticides were detected at sampling locations in landscaped areas of the Park, making it likely that the low pesticide detections were attributable to groundskeeping activities. These detections will be addressed by the provisions specified in this RAP.
- Groundwater was observed between approximately 19 and 24 feet below existing grade (relative to the landscaped area) and, based on the presence of weathered bedrock in soil borings, may be attributed to a perched water table. No odors, sheens, or other potential signs of groundwater contamination were observed during the Phase II investigation.
- PCE and cis-1,2-dichloroethylene (cis-1,2-DCE) were detected in one groundwater sample at concentrations slightly above their respective Class GA AWQS. No other VOCs were detected above their respective Class GA AWQS. These detections will be addressed by the provisions specified in this RAP.
- No SVOCs were detected at concentrations above their respective Class GA AWQSSs. No PCBs or pesticides were detected in groundwater samples.

- Metals were detected in the filtered and unfiltered groundwater samples, with 21 Class GA AWQS exceedances in unfiltered samples, and 16 Class GA AWQS exceedances in the filtered samples, indicating that concentrations of at least five metals (beryllium, chromium, lead, mercury, and nickel) were attributable to metals absorbed to suspended solids in the unfiltered groundwater samples. The metals detections were typical of groundwater at many urban sites, including throughout Manhattan. These detections will be addressed by the provisions specified in this RAP.
- TCE was detected in soil vapor at one location at a concentration of 4 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$), slightly exceeding the NYSDOH Air Guidance Value for *indoor* air quality of $2 \mu\text{g}/\text{m}^3$. No other VOCs were detected above the NYSDOH Air Guidance Values for indoor air quality and the remaining VOC detections were relatively low and typical of soil vapor at many urban sites, including throughout Manhattan. The NYSDOH Air Guidance Values are guidance values for protection of indoor air quality and not intended to be used for direct comparison of soil vapor concentrations, which are expected to decrease due to retardation, decay, and dilution in the subsurface (collectively referred to as site-specific attenuation factors) prior to impacting any enclosed spaces. Based upon the soil vapor sampling data collected as part of the Phase II Investigation and the site-specific attenuation factors, the existing conditions pose a minimal risk for vapor intrusion for the existing building and proposed Gilder Center construction. Notwithstanding as a conservative measure, provisions to address vapor intrusion have been incorporated into this RAP.

Geotechnical Engineering Study, American Museum of Natural History, Gilder Center, New York, New York, Langan, April 2017

Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C. of New York, New York (Langan) completed a Geotechnical Engineering Study to support the foundation and construction design for the proposed project.

Based upon the findings from the installation of geotechnical soil borings, groundwater wells, and test pits, the study characterized subsurface material at the Museum to consist of fill material (comprising sand with varying amounts of silt, gravel, rock fragments, and debris), underlain by sand, decomposed rock, and bedrock at varying depths. Shallow bedrock and shallow, potentially perched groundwater were noted in the subsurface.

The study concluded that any soil remaining after construction excavation would require compaction prior to shallow foundation construction, and that dewatering may be required during construction activities. A membrane-type waterproofing solution was also recommended for installation under or behind any proposed subgrade walls or slabs, which would also satisfy the vapor proofing requirements discussed in Section 4.2 of this RAP.

A copy of these previous reports is provided in Appendix A.

3.0 CONSTRUCTION MEASURES

The proposed project work would entail soil disturbance for construction excavation, including foundation construction and landscaping. Soil disturbance throughout most of the RAP Site would be limited to depths between 1 and 20 feet below grade. Based on the anticipated depth to groundwater, construction dewatering may also be required.

Soil and fill materials containing generally low concentrations of some VOCs, SVOCs, metals, and pesticides were identified on-site and may be encountered during soil disturbance for the proposed project. Soil handling procedures are provided in Sections 3.2 and 3.4. A groundwater management plan is provided in Section 3.6.

The previous studies identified petroleum storage tanks on-site. A contingency plan for the removal of any unexpectedly encountered tanks is provided in Section 3.3. In the event that contaminated soil (e.g., petroleum-contaminated soil) is encountered, a contingency plan is provided in Section 3.2 for appropriate handling, testing, and disposal of these materials during general excavation.

The project design will incorporate measures to minimize potential impacts after construction, as described in Section 4.0. Following completion of subsurface work, a New York State licensed Professional Engineer (PE)-certified closure report will be submitted to the NYCDEP for review and approval. The report will include a description of all construction activities and evidence of consistency with and any deviations from this RAP, copies of manifests/bills of lading associated with off-site disposal of material, photographs of the work, and any laboratory results received for additional sampling during construction including waste characterization, off-site disposal purposes, and imported soil.

3.1 Pre-Demolition Surveys

Prior to the onset of any demolition activities, surveys shall be conducted in all proposed demolition areas to identify all potential asbestos-containing materials (ACMs), lead-based paint (LBP), and polychlorinated biphenyl (PCB) containing materials. All suspect materials identified in the surveys shall be managed, removed, and disposed of off-site in accordance with all federal, state, and local requirements.

3.2 Soil Disposal

If sludges, soil, or sediment known to be contaminated or showing evidence of potential contamination, such as discoloration, staining, or odors are encountered during excavation activities, the following procedures will be implemented:

1. Spill reporting to the NYSDEC Spill Hotline (800-457-7362) will be conducted, as necessary.
2. The suspect soil will be sampled for laboratory analyses. Soil samples will be analyzed, at a minimum, for parameters required by the intended disposal facility. Additional analytical requirements may be required based on the nature of the contamination.
3. If the suspect soil is determined to be significantly contaminated according to analytical results, it will be excavated and removed in accordance with the stockpiling and/or direct-loading procedures presented in Section 3.2.2 and 3.2.3, respectively.
4. The excavation will continue vertically until no evidence of contamination is noted in the base of the excavation or until groundwater or bedrock is encountered. The excavation will continue horizontally until no evidence of contamination is noted in the sidewalls of the excavation. Post-excavation endpoint samples will be collected from the sides and bottom of the excavated area and analyzed in accordance with the NYSDEC Commissioner's Policy CP-51, dated October 2010 (CP-51) or NYSDEC Division of Environmental Remediation

- DER-10, based on the nature of the identified contamination. If post-excavation samples exceed action levels, then additional excavation will be performed, as warranted.
5. Soils intended for off-site disposal will be tested in accordance with the requirements of the receiving facility (as discussed further in Section 3.2.1), and disposed of in accordance with applicable federal, state and local requirements. If additional sample analyses are required by alternative disposal facilities, additional analysis may be run on existing sample material at the laboratory as long as all holding time and preservation requirements have not been exceeded.
 6. All analytical results, including endpoint sample and excavated soil characterization sampling results, must be received, reviewed, and discussed by the project team before the soil excavation can be backfilled, and before the excavated material can be disposed of off-site, as additional samples may need to be collected.
 7. The excavated soil will then be disposed of in accordance with all applicable federal, state and local regulations.
 8. Copies of correspondence with disposal facilities concerning classification of materials, testing results, and permits/approvals will be maintained by the project manager and will be submitted to NYSDEC in a Spill Closure Report, as necessary.

When applicable, hazardous waste manifest forms and/or non-hazardous waste records will be completed as required by the appropriate regulatory agencies for verifying the material and quantity of each load in units of volume and weight.

3.2.1 Off-site Disposal and On-Site Soil Reuse Criteria

Existing soil/fill intended to be excavated during the construction activities will be characterized at a rate of one representative sample for every 800 cubic yards of soil/fill. This waste characterization sampling may be conducted in-situ using a grid-based system.

Each sample will be analyzed for NYSDEC Part 375 VOCs, SVOCs, pesticides, PCBs and TAL metals, and other parameters required by the intended disposal facilities. This data may also be utilized to evaluate appropriate disposal facility options, as well as the potential suitability for reuse on-site, based on the following criteria:

- Soil that meets the Part 375 CSCOs may be reused on-site below the remedial site cap, as defined in Section 4.1; and
- Soil that meets the Part 375 RRSCOs may be segregated and maintained on-site for potential reuse on-site as part of the remedial site cap, as defined in Section 4.1, pending additional sampling (one sample for every 250 cubic yards of proposed material for NYSDEC Part 375 VOCs, SVOCs, pesticides, PCBs, and TAL metals).

In addition to the criteria above, reuse procedures in Section 3.2.2 of this RAP shall also be followed.

Off-site disposal analytical thresholds will be determined by the individual disposal facilities.

3.2.2 Stockpiling Procedures

No petroleum-contaminated soil encountered that is excavated from the RAP Site will be re-used on-site for grading or other purposes.

Any contaminated material intended for off-site disposal may be stockpiled temporarily or loaded directly onto trucks for off-site disposal, if pre-approved by the receiving facility.

Soil with contamination established by laboratory analytical data or exhibiting field-screening evidence of contamination will be stockpiled on polyethylene sheeting following excavation. If the soil is expected to remain on-site overnight or longer, the stockpile will be covered with similar polyethylene sheeting, which will be secured with large rocks or other appropriate weights to protect against leaching or runoff of contaminants into groundwater or stormwater. Stockpiles will be managed to minimize particulate generation, and run-off and erosion using water, plastic covers, silt fences, and/or hay bales, as necessary.

Silt fencing and/or hay bales will be used as needed near catch basins, and other discharge points in remedial construction and auxiliary monitoring areas to serve as a stormwater pollution prevention measure.

Soil will be segregated and stockpiled based on its known or anticipated type and/or level of contamination (based on analytical data, PID readings, odor, staining, etc.). Stockpiles will be separated by a sufficient distance to ensure that mixing of dissimilar or potentially dissimilar materials does not occur. The location and classification of stockpiles will be tracked on site drawings and updated, if necessary, at the end of each workday according to the following categories:

- Soil intended and approved by NYCDEP for reuse on-site (reuse criteria specified in Section 3.2.1);
- Non-petroleum contaminated, non-hazardous soil for off-site disposal;
- Non-petroleum contaminated, hazardous soil for off-site disposal;
- Petroleum-contaminated soil for off-site disposal; and
- Soil pending analysis, if in-situ testing is infeasible.

Copies of site drawings will be kept in the field log book. Stockpiles intended for off-site disposal may be mixed with other compatible stockpiles on-site (compatibility will be determined by the requirements of the receiving disposal facility), but hazardous or petroleum contaminated wastes will not be mixed with other non-hazardous wastes.

3.3 Petroleum Tank Closure

Three ASTs and one UST were identified in the Phase I ESA. If additional tanks are unexpectedly encountered and can be removed, these tanks and any appurtenances will be cleaned and closed in accordance with accepted industry standards and applicable federal, state, and local regulatory agency requirements. Any additional tanks that cannot be removed would be closed in place, in accordance with accepted industry standards and applicable federal, state, and local regulatory agency requirements.

Tank closure and any soil removal from the vicinity of any discovered USTs will be conducted in accordance with the NYSDEC Divisions of Spills and Response Memorandum on Permanent Closure of Petroleum Storage Tanks, dated July 1998, and updated in December 2003, and NYSDEC CP-51. Laboratory testing of both characterization samples and of samples obtained from the excavation areas will include NYSDEC CP-51 VOCs and SVOCs.

Any unregistered tanks encountered at the RAP Site will be registered with NYSDEC. Tank closure activities and any associated petroleum-contaminated soil removal will be documented in a separate Tank/Spill Closure Report, which will be submitted to NYSDEC to document all activity related to the formerly unregistered tanks.

Typical tank closure procedures are summarized below:

1. Open fill cap or vent pipe and measure for product. If measurable product exists, collect a sample of the product. Tank contents will be sampled in accordance with applicable federal, state, and local requirements and tested in accordance with the requirements of the receiving facility. Proper disposal of tank contents at an approved facility will be dictated by sample results.
2. Vacuum liquid tank contents and pumpable tank bottom residue.
3. Excavate around the tank with care to avoid release of any residual tank and piping contents. Hand excavation around the tank may be necessary. The sidewalls of all excavated areas will be properly stabilized in accordance with Occupational Safety and Health Administration (OSHA) regulations. Continuously monitor the excavated areas in the worker breathing zone for the presence of flammable, toxic, or oxygen-deficient atmosphere with a PID, a combustible gas indicator (CGI), and an oxygen meter.
4. Inert the tank of flammable vapors using dry ice and verify inertness using an oxygen meter (less than 7 percent). An access hole will be cut in the tank and the tank will be thoroughly cleaned of residual liquids and sludges.
5. Entry of the tank, if necessary, will be conducted in conformance with OSHA confined space requirements.
6. Remaining fuels, loose slurry, sludge materials and wastewater will be collected in Department of Transportation (DOT)-approved drums, sampled and analyzed for disposal characterization. After disposal characterization, waste material will be removed and disposed of in accordance with applicable regulations.
7. Remove the tank and all associated piping from the ground and clean the outside of the tank. The tank and piping will be rendered "not reusable," removed from the RAP Site and disposed of according to applicable regulations with proper documentation. If present, remove and dispose of all concrete tank support structures or vaults, as encountered.
8. After tank removal, examine for evidence of petroleum releases in accordance with the NYSDEC Memorandum on Permanent Closure of Petroleum Storage Tanks. If there is evidence of a petroleum release, follow procedures for Soil Disposal provided in Section 3.2, in addition to the procedures below.
9. If the tank cannot be physically removed due to structural concerns, it will be cleaned following the procedures described in Items 1, 2, 4, 5, and 6 above. Following cleaning, the tank will be permanently closed by filling the tank with a solid, inert material such as cement slurry or foam in accordance with NYSDEC guidance and regulations.
10. Spill reporting to the NYSDEC Spill Hotline (800-457-7362) will be conducted, if deemed necessary in consultation with NYCDEP and the project team.
11. All excavated materials will be field-screened with a PID. If soil contamination is present, excavate and remove contaminated soil from the tank areas in accordance with the stockpiling and/or direct-loading procedures presented in Sections 3.2.2 and 3.2.3, respectively. Material will be excavated, to the extent practicable, until field screening with a

PID yields concentrations of less than 20 ppm and until there are no remaining visible signs of contamination or odors. After contaminated soil removal, collect endpoint samples at each sidewall and at the bottom of the excavation for analytical testing as specified in NYSDEC CP-51.

12. Photo-document all procedures and record all procedures in a bound field notebook.
13. Copies of all testing results, correspondence with disposal facilities concerning classification of materials, and permits/approvals will be maintained by the project manager and will be submitted to the NYSDEC in a Tank Closure Report, as warranted.
14. A signed affidavit will be prepared by the licensed tank installation (removal) contractor and submitted to the New York City Fire Department certifying proper removal of the tank(s).

3.4 Waste Management and Transportation

Transportation of all material leaving the RAP Site for off-site disposal, including but not limited to soil, groundwater, or scrap metal, will be in accordance with federal, state and local requirements (including 6 NYCRR Part 364 and U.S. DOT regulations) covering licensing of haulers and trucks, placarding, truck routes, manifesting, etc.

The schedule for truck arrival will be coordinated to meet the approved project schedule. The schedule will be compatible with the availability of equipment and personnel for material handling operations at the job site. Trucks will be protected against contamination by properly covering and lining truck beds with compatible material (such as polyethylene) or by decontaminating them prior to any use other than hauling contaminated materials.

All vehicles leaving the RAP Site will be inspected to ensure that contaminated soil adhering to the wheels or under carriage is removed prior to the vehicle leaving the RAP Site. Any situations involving material spilled in transit or mud and dust tracked off-site will be remedied. The truck access routes will be evaluated for road conditions, overhead clearance, and weight restrictions.

Contaminated materials from other projects will not be combined with material from the construction area. The transporter will not deliver waste to any facility other than the disposal facility(s) listed on the shipping manifest.

3.5 Dust Control

To prevent the potential migration of dust generated during soil disturbance activities, the following measures will be implemented during all soil-disturbing operations:

- Water will be available (and used) for sprinkling/wetting to suppress dust in dry weather or as necessary.
- All haul trucks will have tarp covers.
- Stabilized construction exits (e.g., gravel pads) and wash stations will be placed strategically to prevent tracking out of, or dispersion of dust.

All work that involves soil disturbance or otherwise generates dust will be performed utilizing these methods to minimize dust generation to the extent practicable. Particulate air monitoring requirements will be conducted as discussed below.

3.5.1 Work Zone Air Monitoring

A work zone air monitoring program will be implemented during soil and groundwater disturbance activities to reduce exposure of all on-site field personnel, and to mitigate

potential impacts in off-site areas due to on-site work. Results of this air monitoring will be used to determine appropriate response actions.

A Dust Trak[®] particulate monitor or equivalent would be used to measure real-time concentrations of total particulates 10 micrometers or less (PM10), and a PID would be used to measure real-time total VOC concentrations. The particulate monitor and PID would be calibrated with a zero filter, and isobutylene, respectively in accordance with the manufacturer's recommendations.

Measurements for particulates and VOCs would be taken prior to commencement of the work to establish daily background concentrations, and then continuously during the soil-disturbance work.

For work zone monitoring, instantaneous readings will be collected every second, with one reading logged every minute locally on the device. The instantaneous data will be used to establish running 15-minute averages for both particulate and VOC monitoring data. A local alarm will be established on both monitoring devices to alert the user when the work zone 15-minute averages are in exceedance of the action levels presented below in Table 1. Work zone air monitoring measurements would be made as close to the workers as practicable and at their breathing height.

Table 1
Work Zone Action Levels and Required Responses

| Instrument | Action Level ¹ | PPE ² Requirements and Response Action |
|--------------------------------------|---|---|
| Particulate Monitoring | Less than 5 mg/m ³ | -Level D or D-Modified (Requires coveralls and steel toe boots) (As applicable: Chemical resistant gloves, chemical resistant boot covers, Hard hat, safety glasses, face shield, or escape mask) |
| | Between 5 mg/m ³ and 125 mg/m ³ | -Level C. (Requires Full Face or half face respirator, Hooded chemical resistant two piece Tyvek suite or overalls, Chemical resistant inner and outer gloves, Chemical resistant boot covers, Steel toe and shank boots) (As applicable: Hard hat, face shield, or escape mask) -Apply dust suppression measures. If less than 5 mg/m ³ , resume work using Level D. Otherwise, upgrade Level C. |
| | Above 125 mg/m ³ | -Stop work. -Apply additional dust suppression measures. Resume work when less than 125 mg/m ³ and maintain Level C. |
| Volatile Organic Compound Monitoring | Less than 10 ppm in breathing zone. | -Level D or D-Modified |
| | Between 10 and 100 ppm | -Level C. |
| | More than 100 ppm | -Stop work. -Resume work when source of vapors is abated and readings are less than 100 ppm above background |

Notes:

1: 15-minute time-weighted average, parts per million (ppm), milligrams per cubic meter (mg/m³).

2: PPE – Personal protective equipment

3.5.2 Community Air Monitoring Plan

Community air monitoring plan (CAMP, or perimeter monitoring) locations will be established on a daily basis and will consist of upwind and downwind locations at the perimeter of the remedial construction and/or auxiliary monitoring areas. Perimeter monitoring will be conducted continuously during soil disturbance activities using monitoring stations to determine whether on-site work is impacting air at the perimeter of the remedial construction and/or auxiliary monitoring areas, and to trigger work zone dust and odor mitigation controls to mitigate the impacts.

Measurements for particulates and VOCs would be taken prior to commencement of the work to establish daily background concentrations, and then continuously during the soil-disturbance work.

For community air monitoring, instantaneous readings will be collected with one reading logged every minute on a remote server. The data will be used to record running 15-minute averages for both particulate and VOC monitoring data. One minute and 15-minute data points will be stored on the remote server and presented in the RAP Closure Report. Remote, and local alarms will be established on both monitoring devices to alert the user when the community monitoring 15-minute averages are in exceedance of the action levels presented below in Table 2.

Table 2
Perimeter Action Levels and Required Responses

| Instrument | Action Level ¹ | Response Action |
|--|--|--|
| Particulate Monitoring | Less than 0.100 mg/m ³ above background concentration | -Continue on-site work in accordance with RAP. |
| | Between 0.100 mg/m ³ and 0.150 mg/m ³ above background concentration | -Apply dust suppression measures in work zone (i.e., minimum of spraying down work areas with water, other measures to be determined based on particulate-generating activity). -If particulate levels decrease to less than 0.100 mg/m ³ above background concentrations, resume work in accordance with RAP. |
| | Above 0.150 mg/m ³ above background concentration | -Stop work. -Apply additional dust suppression measures. If particulate concentrations decrease to below 0.100 mg/m ³ , resume work in accordance with RAP. |
| Volatile Organic Compound Monitoring | Less than 5 ppm above background concentration | -Continue on-site work in accordance with RAP. |
| | Between 5 and 25 ppm above background concentration | -Apply VOC suppression measures in work zone. -If VOC levels decrease to less than 5 ppm above background concentrations, resume work in accordance with RAP. |
| | More than 25 ppm above background concentration | -Stop work. -When source of vapors is abated and readings are less than 25 ppm above background, resume work in accordance with RAP. |
| Note: 1: 15-minute time-weighted average, parts per million (ppm), milligrams per cubic meter (mg/m ³) | | |

3.6 Groundwater Management Plan and Water Proofing

Based on the findings of the geotechnical and Phase II investigations, some dewatering may be required. Dewatering discharge water must meet the NYCDEP criteria for effluent to municipal sewers, in accordance with the NYCDEP Bureau of Wastewater Treatment (BWT) Wastewater Quality Control Permit, and all dewatering would require an appropriate permit (e.g., NYCDEP sewer discharge permit or NYSDEC State Pollutant Discharge Elimination System [SPDES] permit) or approval. Groundwater testing, and possibly pre-treatment (dependent upon the testing results), may be necessary to comply with NYCDEP requirements.

Alternatively, if the quantity of dewatering is limited, the water could be pumped, transported off-site and disposed of in accordance with applicable requirements.

As the proposed project is expected to extend beyond the observed groundwater table, a sheet-applied waterproofing membrane would be installed as part of foundation construction, in accordance with the recommendation made in Langan's *Geotechnical Engineering Study*. The waterproofing product will serve as a component of the remedial site cap, discussed in Section 4.1. Manufacturer's specifications for any proposed waterproofing products will be submitted to NYCDEP for review and approval prior to installation.

3.7 Storm-Water Pollution Prevention

Applicable laws and regulations pertaining to stormwater pollution prevention will be addressed during the proposed work. Erosion and sediment control measures identified in this RAP (silt fences and barriers and/or hay bale checks) will be installed around the entire perimeter of the remedial construction areas and inspected once a week and after every storm event to ensure that they are operating appropriately. Discharge locations will be inspected to determine whether erosion control measures are effective in preventing significant impacts to receptors. Results of inspections will be recorded in a logbook and maintained at the job site and available for inspection by NYCDEP. All necessary repairs shall be made immediately. Accumulated sediments will be removed as required to keep the silt fence and/or hay bale barriers functional. Undercutting or erosion of the silt fence anchor will be repaired immediately with appropriate backfill materials. Manufacturer's recommendations will be followed for replacing silt fencing damaged due to weathering.

4.0 POST-EXCAVATION MEASURES

4.1 Importation of Fill and Site Cap

Prior to importation, clean fill/soil will be tested at the source facility at a frequency of one sample per 250 cubic yards for NYSDEC Part 375 VOCs, SVOCs, pesticides, PCBs, and metals and must meet the Part 375 RRCSCOs.

Recycled concrete aggregate (RCA) for use as backfill will only be allowed for import from facilities permitted or registered by NYSDEC. RCA material is not acceptable for, and will not be used as cover material. Facilities will be identified in the RCR. A PE or Qualified Environmental Professional (QEP) is responsible to ensure that the facility is compliant with 6NYCRR Part 360 registration and permitting requirements for the period of acquisition of RCA. RCA imported from compliant facilities will not require additional testing, unless required by NYSDEC under its terms for operation of the facility. RCA imported to the RAP Site must be derived from recognizable and uncontaminated concrete.

Following excavation and backfilling work, portions of the RAP Site will be capped by concrete, pavement, or other impervious materials as determined by the proposed development plans. In

soil excavation areas that will not be capped with impervious materials, a “soil cap” will be required and will consist of two feet of imported clean fill or existing on-site soils meeting the criteria for on-site reuse, as specified in Section 3.2.1. A demarcation layer, comprising construction fencing or geotextile fabric, will be installed below the clean soil cap and will act as a visual barrier between undisturbed soil and the clean soil cap.

It is anticipated that, in some proposed work areas, only limited soil disturbance will occur and the above capping requirements cannot be conducted without the risk of damage to existing landscaping including nearby mature trees. In these areas, any existing soil removed from the existing planting bed would be replaced with clean fill/soil meeting the above criteria and to the extent possible, some combination of a clean soil cap and mulch would still be installed. Soil restoration will not be required in areas where no existing soil is disturbed.

Upon completion of remedial site cap material sampling, a detailed remedial site cap report will be submitted to NYCDEP for review and approval prior to importation or on-site reuse. The report will include, at a minimum, an executive summary, narrative of the field sampling activities, laboratory data, and comparison of analytical results to the Part 375 RRSCOs.

4.2 Vapor Barrier

While the previous studies did not reveal evidence of a vapor intrusion concern, the proposed development is expected to extend beyond the observed groundwater table. As such, a sheet-applied waterproofing membrane will be installed as part of foundation construction as a conservative measure, in accordance with the recommendation made in Langan’s *Geotechnical Engineering Study*. A properly installed waterproofing layer would mitigate potential future vapor impacts at the RAP Site. Manufacturer’s specifications for any proposed waterproofing products will be submitted to NYCDEP for review and approval prior to installation.

5.0 QUALITY ASSURANCE/QUALITY CONTROL

All necessary analyses will be performed by a laboratory that has received approval from the New York State Department of Health’s Environmental Laboratory Approval Program (ELAP) for the methods that require analysis.

5.1 Sample Collection

Samples will be collected in accordance with the following procedures:

- Record sample observations (evidence of contamination, PID readings, soil classification) in field log book. If sampling using drilling technology, also maintain a dedicated soil boring log for each discrete boring location.
- Collect an aliquot of soil or groundwater using a dedicated and disposable plastic sample spoon or sample bailer and place in laboratory-supplied sample jars. Grab samples will be collected for VOC analyses. Composite samples will be collected for all other analyses, unless otherwise specified by the disposal facility.
- Seal and label the sample jars as described in Section 5.4 below and place in a chilled cooler.

5.2 Decontamination Procedures

To avoid contamination and cross-contamination of samples, only dedicated or disposable sampling equipment may be used to collect these samples. All non-disposable equipment involved in field sampling must be decontaminated before being brought to a sampling location, and must be properly decontaminated after use.

5.3 Sample Identification

All samples will be consistently identified in all field documentation, chain-of-custody documents and laboratory reports using an alpha-numeric or alpha-alpha code. For stockpiled soil, the alpha prefix will be “SP” and the numbers following the alpha prefix will correspond to excavated stockpiles, beginning with “1, 2, 3...”. For example, the first sample collected from the first stockpile will be labeled “SP-1-1” and the first sample collected from the second stockpile will be labeled “SP-2-1.”

For groundwater samples, the alpha prefix will be “GW” and the number following the prefix will correspond to the sample number. For example, the first groundwater sample collected for sample analysis will be labeled “GW-1” and the second sample will be “GW-2.”

5.4 Sample Labeling and Shipping

All sample containers will be labeled with the following information:

- Site identification
- Sample identification
- Date and time of collection
- Analysis(es) to be performed
- Sampler’s initials

Once the samples are collected and labeled, they will be placed in chilled coolers and stored in a cool area away from direct sunlight to await shipment to the laboratory. Samples will be shipped to the laboratory at a frequency that will not result in an exceedance of applicable holding times for sample methods. At the start and end of each workday, field personnel will add ice to the coolers as needed.

The samples will be prepared for shipment by placing each sample jar in a sealable plastic bag, then wrapping each bag in bubble wrap to prevent breakage, adding freezer packs and/or fresh ice in sealable plastic bags, and maintaining the chain-of-custody form(s) with the sample cooler(s). Samples will be shipped overnight (e.g., Federal Express) or transported by a laboratory courier to the designated laboratory. All coolers shipped to the laboratory will be sealed with mailing tape and a chain-of-custody (COC) seal to ensure that the coolers remain sealed during delivery.

5.5 Sample Custody

Field personnel will be responsible for maintaining the sample coolers in a secured location until they are picked up and/or sent to the laboratory. The record of possession of samples from the time they are obtained in the field to the time they are delivered to the laboratory or shipped off-site will be documented on COC forms. The COC forms will contain the following information: project name; names of sampling personnel; sample number; date and time of collection, sample matrix; and the signatures of individuals involved in, and the dates and times of sample transfers. Laboratory personnel will note the condition of the custody seal and sample containers at sample check-in.

5.6 Sample Documentation

A sample log book will be maintained. The following information, as a minimum will be recorded to the log.

- Sample identification number

- Sample location
- Field Observations
- Sample Type
- Analyses
- Date/Time of collection
- Collector's name
- Sample procedures and equipment utilized
- Date sent to laboratory/name of laboratory
- Copies of Site drawings indicating stockpile numbers and locations

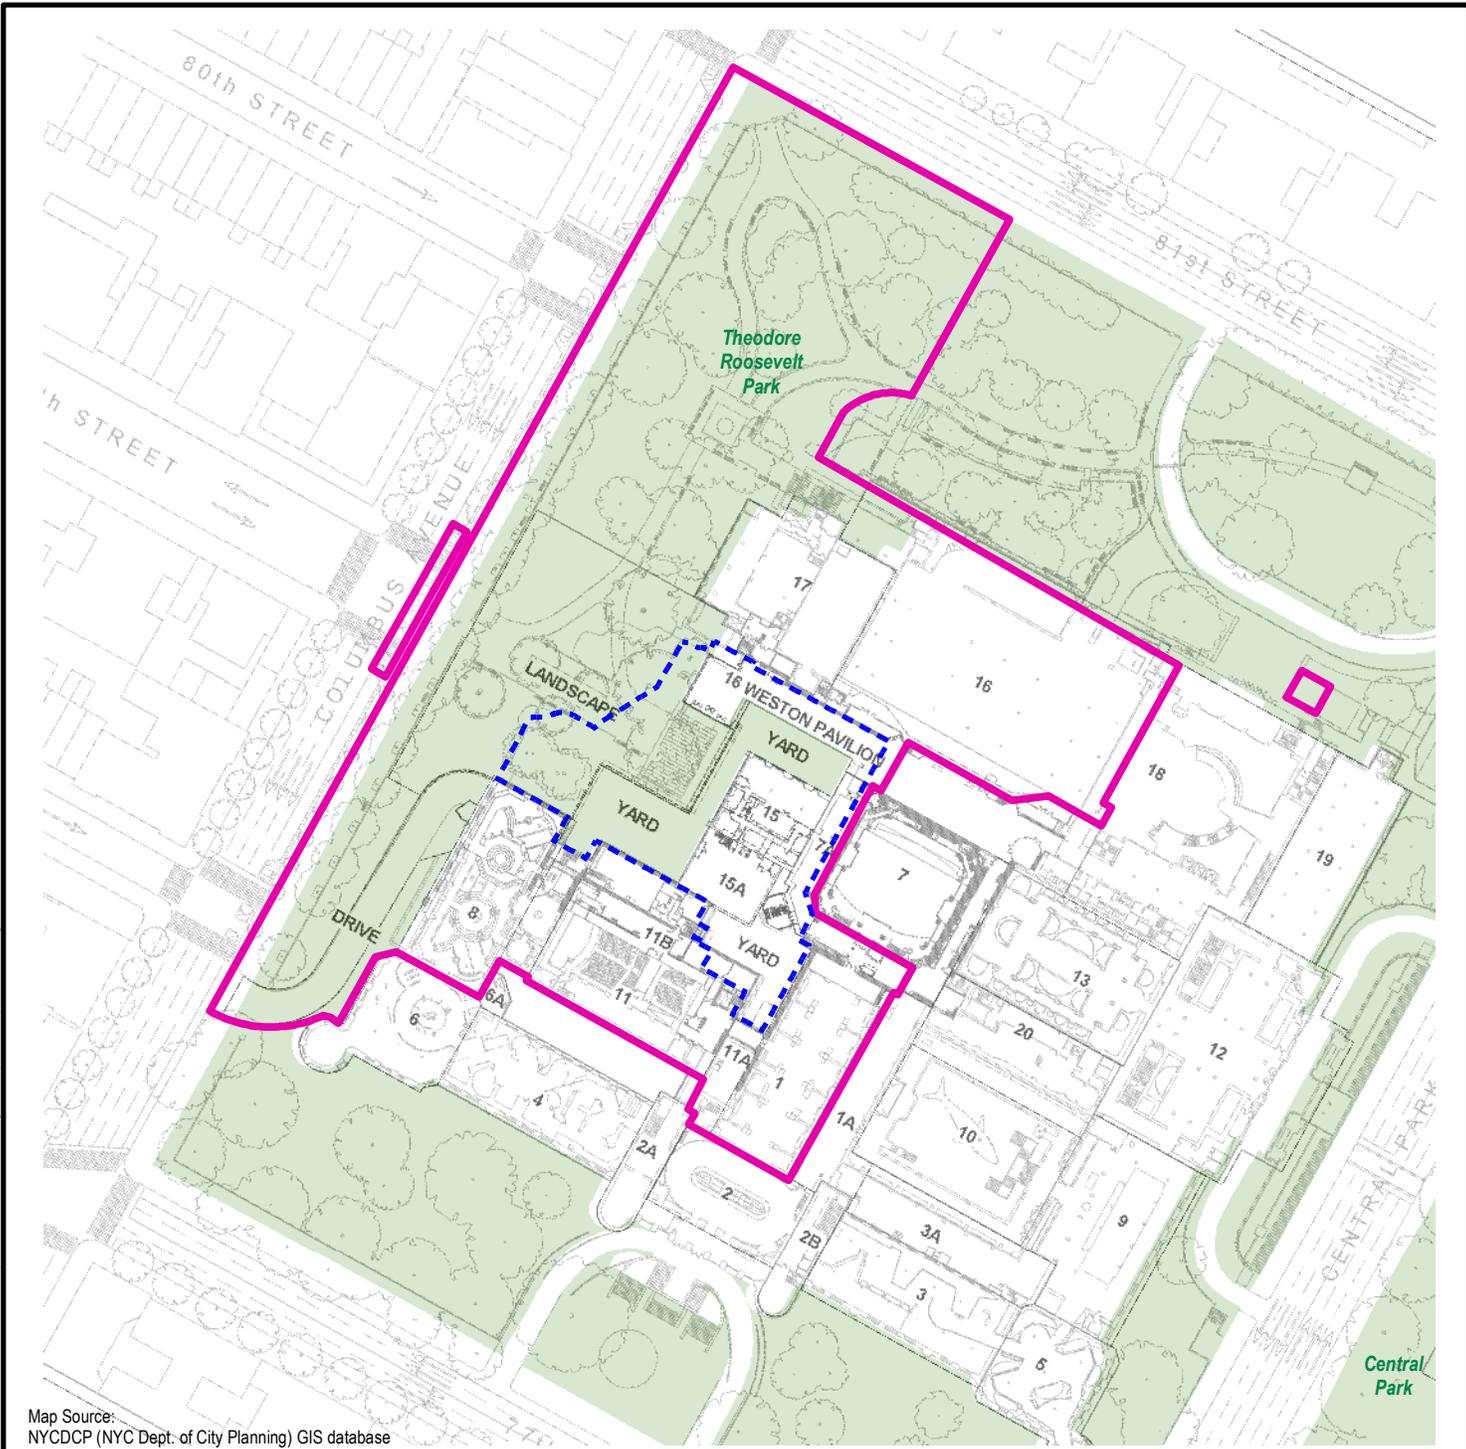

6.0 CLOSURE REPORT AND DOCUMENTATION

Upon completion of all NYCDEP-approved remedial requirements outlined in this RAP, a P.E.-certified Remedial Closure Report will be submitted to NYCDEP for review and approval. This report will demonstrate that all remedial activities have been properly implemented. At a minimum, the report will include all transportation manifests, soil disposal/recycling certificates, proof of importing and grading certified clean fill/top soil for all landscaped areas disturbed by the proposed project, and all soil analytical testing results for any imported fill/top soil.

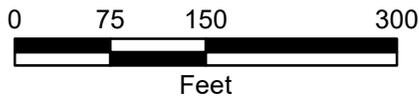

Copies of any pertinent NYSDEC correspondence, including but not limited to tank closure reports, investigative/remedial work plans, reports, and No Further Action letters, etc. will be submitted to NYCDEP as part of the Remedial Closure Report for filing purposes.

- APPENDIX B – Report Forms
- APPENDIX C – Emergency Hand Signals

1.0 INTRODUCTION

This Construction Health and Safety Plan (CHASP) was prepared in conjunction with the Remedial Action Plan (RAP) for the proposed Gilder Center project at the American Museum of Natural History (AMNH or the Museum) in Theodore Roosevelt Park. The proposed project comprises construction of the Gilder Center, which entails partial or full demolition of portions of the Museum including Sections 1, 7A, 8, 11, 11A, 11B, 15, 15A, 16, and 17, Weston Pavilion, the new location of The New York Times Capsule, and adjacent Museum yards, along with improvements to an approximately 75,000-square foot (SF) portion of Theodore Roosevelt Park and adjacent areas during construction of the proposed project (collectively, and as shown on Figure 1, as the “Remedial Action Plan Site” or “RAP Site”). The RAP Site, along with the remainder of the Museum buildings and grounds, are located at 200 Central Park West, on New York City-owned mapped parkland under the jurisdiction of the New York City Department of Parks and Recreation (NYC Parks) and defined legally as Tax Block 1130, part of Lot 1, as shown on Figure 1.

Areas where on-site subsurface disturbance work, related construction activities, and related construction mitigation measures will occur are referred to as remedial construction areas. Portions of the RAP Site outside of remedial construction areas where certain construction mitigation measures described in this RAP may be implemented, such as community air monitoring and some storm-water pollution prevention measures, will be referred to as auxiliary monitoring areas. Other portions of the RAP Site outside of both the remedial construction areas, and auxiliary monitoring areas may not require any mitigation measures based upon the proposed project-related work, and the proximity of the area relative to remedial construction areas and auxiliary monitoring areas. The boundaries and locations of the remedial construction areas, auxiliary monitoring areas, and other portions of the RAP Site will change throughout the duration of the proposed project work based upon the locations of construction work areas. The applicable construction mitigation measure logistics will be reevaluated throughout the duration of the proposed project work to reflect the changing work area boundaries.

Previous investigations indicated that on-site soil consists of historic fill materials with low levels of contaminants typical of soil at many urban sites, including throughout Manhattan. The purpose of this CHASP is to assign responsibilities, establish personnel protection standards and mandatory safety practices and procedures, and outline contingency measures with respect to health and safety in the event that unknown contamination is encountered. The CHASP is intended to minimize health and safety risks resulting from the known low levels of contaminants or potential presence of subsurface hazardous materials.

This plan is not designed to address geotechnical, mechanical, or general construction safety concerns, which will be addressed in separate documents, nor to supersede or replace any Occupational Safety and Health Administration (OSHA) regulation and/or local and state construction codes or regulations.

2.0 APPLICABILITY

Work subject to this CHASP includes all activities that disturb the existing soil on-site. The contractors and their subcontractors involved in the construction project will possess a copy of this CHASP and will provide a copy of this CHASP to their employees whose work involve any potential exposure to the on-site soil, and will complete all work in accordance with this CHASP.

2.1 Hazard Evaluation

The routes of exposure for on-site personnel are breathing of volatile and semi-volatile compounds or particulate-laden air released during soil disturbing activities, dermal contact, and accidental ingestion. Appendix A includes specific health effects from chemicals present or

potentially present on-site. Although some of the chemicals of concern listed in the sections below were not detected during the subsurface investigations, they are included herein as a precaution. The remaining sections of this CHASP address procedures (including training, air monitoring, work practices and emergency response) to reduce the potential for unnecessary and unacceptable exposure to these contaminants.

While many of these compounds are known or suspected to result in chronic illness from long-term exposures at sufficient doses and without the use of the appropriate protective equipment, due to the limited nature of the proposed construction, only acute effects are a potential concern for the proposed project.

This CHASP addresses potential environmental hazards from the presence of hazardous materials. It is not intended to address the normal hazards of construction work, which are separately covered by OSHA regulations and/or local and state construction codes and regulations.

2.1.4 Chemicals of Concern

| Chemicals | REL/PEL/STEL | Health Hazards |
|--|---|--|
| Benzene | REL = 0.1 ppm PEL = 1 ppm STEL = 5 ppm | Irritation eyes, skin, nose, respiratory system; dizziness; headache, nausea, staggered gait; anorexia, lassitude, dermatitis; bone marrow depression, potential occupational carcinogen. |
| Toluene | REL = 100 ppm PEL = 200 ppm STEL = 300 ppm | Irritation eyes, nose; lassitude, confusion, euphoria, dizziness, headache; dilated pupils, lacrimation (discharge of tears); anxiety, muscle fatigue, insomnia; paresthesia (skin tingling or numbness); dermatitis; liver, kidney damage. |
| Ethylbenzene | REL = 100 ppm PEL = 100 ppm | Irritation eyes, skin, mucous membrane; headache; dermatitis; narcosis, coma. |
| Xylenes | REL = 100 ppm PEL = 100 ppm | Irritation eyes, skin, nose, throat; dizziness, excitement, drowsiness, poor coordination, staggering gait; corneal vacuolization; anorexia, nausea, vomiting, abdominal pain; dermatitis. |
| Fuel Oil | REL = 350 mg/m ³ PEL = 400 ppm | Nausea, irritation – eyes, hypertension, headache, light-headedness, loss of appetite, poor coordination; long-term exposure – kidney damage, blood clotting problems; potential carcinogen. |
| Lead | REL=0.1 mg/m ³ PEL=0.05 mg/m ³ | Weakness, lassitude, insomnia; facial pallor, pale eye, anorexia, low-weight, malnutrition, constipation, abdominal pain, colic; anemia; gingival lead line; tremors, paralysis wrists and ankles; encephalopathy; kidney disease; irritation eyes; hypotension. |
| Mercury | REL = 0.1 mg/m ³ PEL = 0.05 mg/m ³ | Irritation eyes, skin; cough, chest pain, dyspnea (breathing difficulty), bronchitis, pneumonitis; tremor, insomnia, irritability, indecision, headache, lassitude (weakness, exhaustion); stomatitis, salivation; gastrointestinal disturbance, anorexia, weight loss; proteinuria. |
| Arsenic | REL = 0.002 mg/m ³ PEL = 0.01 mg/m ³ | Ulceration of nasal septum, dermatitis, gastrointestinal disturbances, peripheral neuropathy, respiratory irritation, hyperpigmentation of skin; potential occupational carcinogen |
| Polycyclic Aromatic Hydrocarbons (PAHs) | PEL = 5 mg/m ³ | Harmful effects to skin, bodily fluids, and ability to fight disease, reproductive problems; [potential occupational carcinogen] |
| Trichloroethylene (TCE) | REL = 25 ppm PEL = 100 ppm STEL = 200 ppm | Irritation eyes, skin; headache, visual disturbance, weakness, exhaustion, dizziness, tremor, drowsiness, nausea, vomiting; dermatitis; cardiac arrhythmias, paresthesia; liver injury; potential occupational carcinogen |
| <p>Comments: REL = NIOSH Recommended Exposure Limit PEL = OSHA Permissible Exposure Limit STEL = OSHA Short Term Exposure Limit ppm = parts per million mg/m³ = milligrams per cubic meter</p> | | |

3.0 HEALTH AND SAFETY OFFICER

A Site Safety Officer (SSO) will be designated by the project team to oversee implementation of overall health and safety for the project. AKRF shall designate an on-site Environmental Safety Officer (ESO) to provide detailed oversight for specific construction activities, as required by the RAP, and will provide the SSO with information regarding routine Site work and/or health and safety issues, if they occur. The SSO and ESO will be competent persons responsible for the implementation of this plan. The SSO and ESO will have completed 40-hour training courses (updated by an annual refresher) that meet OSHA requirements of 29 CFR Part 1910, Occupational Safety and Health Standards. The SSO and ESO have stop-work authorization, which they will execute on their determination of an imminent safety hazard, emergency situation, or other potentially dangerous situation.

3.1 Training

All personnel who enter the work area while activities involving petroleum-contaminated materials or hazardous materials are being performed will have completed a 40-hour training course that meets OSHA requirements of the Code of Federal Regulations, Title 29 (29 CFR) Part 1910, Occupational Safety and Health Standards. In addition, all personnel will have up-to-date 8-hour refresher training. The training will allow personnel to recognize and understand the potential hazards to health and safety. All field personnel must attend a training program, whose purpose is to:

- Make them aware of the potential hazards they may encounter;
- Provide the knowledge and skills necessary for them to perform the work with minimal risk to health and safety; Make them aware of the purpose and limitations of safety equipment; and
- Ensure that they can safely avoid or escape from emergencies.

Each member of the field crew will be instructed in these objectives before he/she goes onto the RAP Site. A site safety meeting will be conducted at the start of the project. Additional meetings shall be conducted, as necessary, for new personnel working at the RAP Site.

3.2 Medical Surveillance Program

All AKRF and contractor or subcontractor personnel performing activities involving petroleum-contaminated materials or hazardous materials at the RAP Site are required to have passed a complete medical surveillance examination in accordance with 29 CFR 1910.120 (f). A physician's medical release for work will be confirmed by the SSO before an employee can begin site activities. The medical release shall consider the type of work to be performed and the required PPE. The medical examination will, at a minimum, be provided annually and upon termination of hazardous waste site work.

3.3 Site Work Zones

During any activities involving subsurface disturbance, the work area must be divided into various zones to prevent the spread of contamination, ensure that proper protective equipment is donned, and provide an area for decontamination.

The Exclusion Zone is defined as the area where exposure to impacted media could be encountered. The Contamination Reduction Zone (CRZ) is the area where decontamination procedures take place and is located next to the Exclusion Zone. The Support Zone is the area where support facilities such as vehicles, fire extinguishers, and first aid supplies are located. The emergency staging area (part of the Support Zone) is the area where all workers on-site would

assemble in the event of an emergency. A summary of these areas is provided below. These zones may be changed by the ESO, depending on that day's activities. All field personnel will be informed of the location of these zones before work begins.

| Task | Exclusion Zone | CRZ | Support Zone |
|--|--|--|---------------------|
| Soil Excavation, and Loading | 10 ft from soil movement area | 25 ft from soil movement area | As Needed |
| Foundation Construction and Dewatering | 10 ft from construction or dewatering area | 25 ft from construction or dewatering area | As Needed |
| Comments: Control measures such as construction fencing, "caution tape" and/or traffic cones will be placed around the perimeter of the work area when work is being done in a public area. | | | |

3.4 Personal Protection Equipment

The personal protection equipment required for various kinds of tasks are based on 29 CFR 1910.120, Hazardous Waste Operations and Emergency Response, Appendix B, "General Description and Discussion of the Levels of Protection and Protective Gear."

AKRF field personnel and other RAP Site personnel shall wear, at a minimum, Level D personal protective equipment. The protection will be based on the air monitoring described in Section 2.6.

3.5 General Work Practices

To protect the health and safety of the field personnel, field personnel will adhere to the guidelines listed below during activities involving subsurface disturbance:

- Eating, drinking, and chewing gum or tobacco are prohibited except in designated areas on the RAP Site. These areas will be designated by the SSO and/or ESO. Smoking, including e-cigarettes, is prohibited throughout the RAP Site.
- Workers must wash their hands thoroughly on leaving the work area and before eating, drinking, or any other such activity.
- The workers should shower as soon as possible after leaving the Site. Contact with contaminated or suspected surfaces should be avoided.
- The buddy system should always be used; each buddy should watch for signs of fatigue, exposure, and heat/cold stress.

3.6 Work Zone Air Monitoring

Monitoring with a particulate air monitor will be conducted during excavation and other earth moving activities only in the event that contamination is encountered. Real time air monitoring will be performed with a photoionization detector (PID) during sampling and excavation work at areas where petroleum or other volatile organic compounds are detected. Measurements would be taken prior to commencement of work and continuously during the work as outlined in the following table. Measurements will be made as close to the workers as practicable and at the breathing height of the workers. The ESO will set up the equipment and confirm that it is working properly. His/her designee may oversee the air measurements during the day. The initial measurement for the day will be performed before the start of work and will establish the back-

ground level for that day. The final measurement for the day will be performed after the end of work. The action levels and required responses are listed in the following table.

Action Levels and Required Safety Response Actions

| Instrument | Task to be Monitored | Action Level | Response Action |
|--|--|---|---|
| PID (OVM 580B or equivalent) | All excavation activities disturbing contaminated soil, if any | Less than 10 ppm in breathing zone. | Level D or D-Modified |
| | | Between 10 and 100 ppm | Level C |
| | | More than 100 ppm | Stop work. Resume work when readings are less than 100 ppm. |
| Particulate monitor (MIE 1000 Personal DataRam or equivalent) | All excavation activities disturbing contaminated soil, if any | Less than 5 mg/m ³ | Level D |
| | | Between 5 mg/m ³ and 125 mg/m ³ | Level C. Apply dust suppression measures. If < 5 mg/m ³ , resume work using Level D. Otherwise, use Level C. |
| | | Above 125 mg/m ³ | Stop work. Apply additional dust suppression measures. Resume work when less than 125 mg/m ³ . |

Field personnel will be trained in the proper operation of all field instruments at the start of the field program. Instruction manuals for the equipment will be on file at the Site for referencing proper operation, maintenance and calibration procedures.

The equipment will be calibrated according to manufacturer specifications at the start of each day of fieldwork. If an instrument fails calibration, the project manager will be contacted immediately to obtain a replacement instrument and arrange for repairs. A calibration log will be maintained to record the date of each calibration, any failure to calibrate and corrective actions taken. The PID will be calibrated each day using 100 parts per million (ppm) isobutylene standard gas.

4.0 DECONTAMINATION PROCEDURES

4.1 Personnel Decontamination

Personnel decontamination (decon), if deemed necessary by the ESO, will take place in a designated decontamination area. This area will be delineated during each stage of work. Personnel decontamination will consist of the following steps:

- Soap and potable water wash and potable water rinse of gloves;
- Coverall removal (if applicable);
- Glove removal;
- Disposable clothing removal; and
- Field wash of hands and face.

4.2 Sampling Equipment Decontamination

Any non-disposable sampling equipment for confirmatory sampling or other equipment that is in contact with contaminated materials will be decontaminated in accordance with the following procedure:

- Double wash with solution of Simple Green[®] and clean tap water;
- Double rinse with clean tap water;
- Rinse with clean distilled water; and
- Allow equipment to air dry.

4.3 Heavy Equipment Decontamination

If heavy equipment comes in contact with contaminated materials, it will be decontaminated prior to being relocated to a clean area or leaving the Site. A designated decontamination pad will be constructed, where soil, dust, or oil will be washed off the exterior, undercarriage, and wheels or tracks of the equipment. Wash water will be collected for treatment and/or disposal.

5.0 EMERGENCY RESPONSE

5.1 Emergency Procedures

In the event that an emergency develops at the Site, the procedures delineated herein are to be immediately followed. Emergency conditions are considered to exist if:

- Any member of the field crew is involved in an accident or experiences any adverse effects or symptoms of exposure while on-site; and
- A condition is discovered that suggests the existence of a situation more hazardous than anticipated.
- A spill of oil or other hazardous materials.

General emergency procedures, and specific procedures for personal injury, and chemical exposure are described below. In the event of an accident or emergency, an Incident Report form should be filled out and placed in the project file. An example Incident Report form is provided in Appendix B. Information on emergency hand signals is provided in Appendix C.

5.1.1 Chemical Exposure

If a member of the field crew demonstrates symptoms of chemical exposure the procedures outlined below should be followed:

- Another team member (buddy) should remove the individual from the immediate area of contamination. The buddy should communicate to the ESO or SSO (via voice and hand signals) of the chemical exposure. The SSO should contact the appropriate emergency response agency.
- Precautions should be taken to avoid exposure of other individuals to the chemical.
- If the chemical is on the individual's clothing, the chemical should be neutralized or removed if it is safe to do so.
- If the chemical has contacted the skin, the skin should be washed with copious amounts of water.

- In case of eye contact, an emergency eye wash should be used. Eyes should be washed for at least 15 minutes.
- All chemical exposure incidents must be reported in writing to the AKRF Health and Safety Officer. The SSO is responsible for completing the Incident Report Form.

5.1.2 Personal Injury

In case of personal injury at the Site, the following procedures should be followed:

- Another team member (buddy) should signal the ESO or SSO that an injury has occurred.
- A field team member trained in first aid can administer treatment to an injured worker.
- If deemed necessary, the victim should then be transported to the nearest hospital or medical center. If necessary, an ambulance should be called to transport the victim.
- The SSO is responsible for making certain that an Incident Report Form is completed. This form is to be submitted to the ESO. Follow-up action should be taken to correct the situation that caused the accident.
- Any incident (near miss, property damage, first aid, medical treatment, etc.) must be reported. The SSO should contact the appropriate emergency response agency.

A first-aid kit, eye-wash, and blood-borne pathogens kit will be kept on-site during the field activities.

5.1.3 Evacuation Procedures

- The SSO will initiate evacuation procedures by signaling to leave the Site or containment structure;
- All personnel in the work area should evacuate the area and meet in the common designated area;
- All personnel suspected to be in or near the contract work area should be accounted for and the whereabouts or missing persons determined immediately; and
- The SSO will then give further instruction.

5.1.4 Procedures Implemented in the Event of a Major Fire, Explosion, or Emergency

- The SSO shall notify the paramedics and/or fire department, as necessary;
- Signal the evacuation procedure previously outlined and implement the entire procedure;
- Isolate the area;
- Stay upwind of any fire;
- Keep the area surrounding the problem source clear after the incident occurs;
- Complete accident report for and distribute to appropriate personnel.

5.1.5 Spill Response

All personnel must take every precaution to minimize the potential for spills during site operations. Any spill will be reported immediately to the SSO and ESO. The ESO will

then determine and report any required spills to the NYCDEP and/or NYSDEC Hotlines. Spill control apparatus (sorbent materials) will be located on-site. All materials used for the clean up of spills will be containerized and labeled separately from other wastes. The ESO, in consultation with AKRF's Project Manager, will determine if additional spill response measures are required.

5.2 Hospital Directions

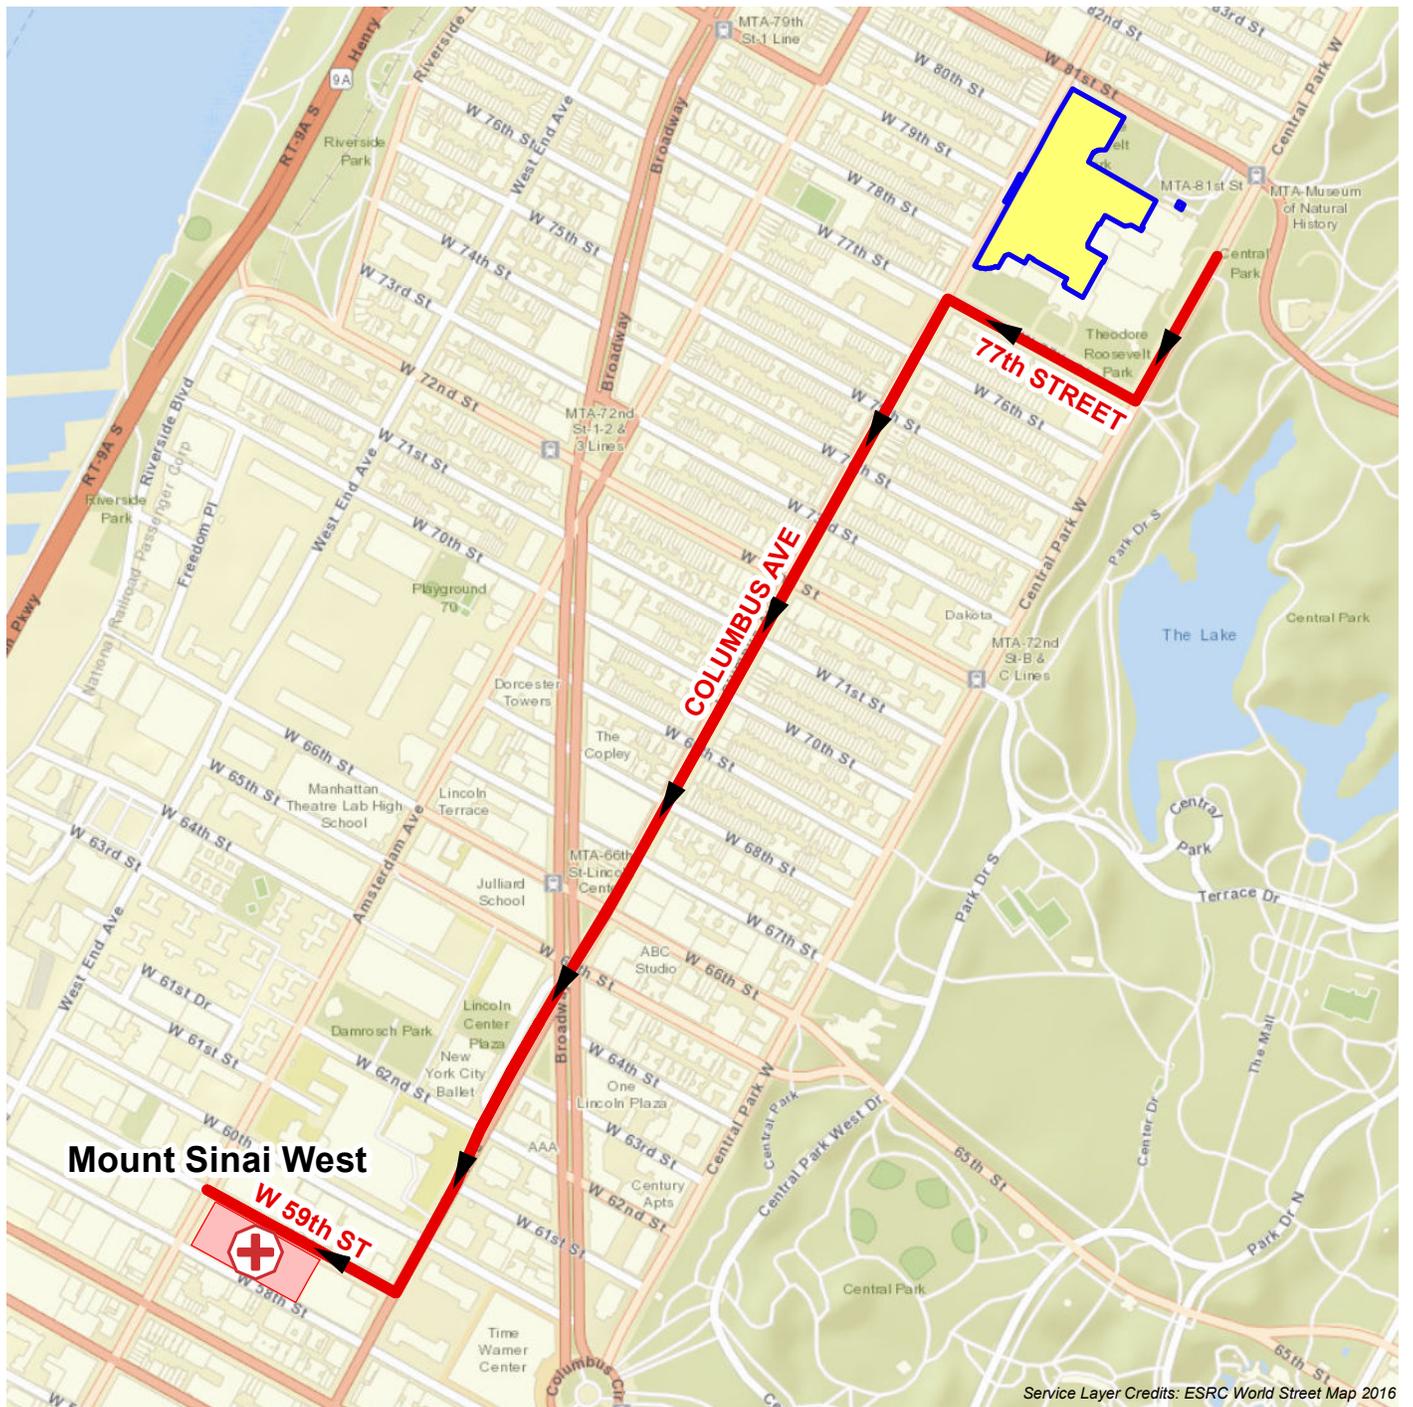

| | |
|--------------------------|--|
| Hospital Name: | Mount Sinai West |
| Phone Number: | (212) 523-4000 |
| Address/Location: | 1000 Tenth Avenue – New York, New York (The Emergency Department is located on West 59 th Street between Columbus Avenue and Amsterdam Avenue) |
| Directions: | 1. Go SOUTH on <i>Central Park West</i> 2. Turn RIGHT onto <i>West 77th Street</i> 3. Go SOUTH on <i>Columbus Avenue</i> 4. Turn RIGHT onto <i>West 59th Street</i> The Emergency Department entrance will be on the LEFT. |

5.3 CHASP Emergency Contacts

| Company | Individual Name | Title | Contact Number |
|--|------------------------|---|--|
| AKRF | Mr. Marc Godick | Project Director | 914-922-2356 (office) |
| | Mr. Eric Park | Project Manager | 646-388-9532 (office) 646-752-5332 (cell) |
| | Mr. William Grossett | AKRF Environmental Safety Officer | 646-388-9546 (office) 734-904-1054 (cell) |
| | Mr. Thomas Giordano | Deputy AKRF Health and Safety Officer | 646-388-9758 (office) 914-602-6956 (cell) |

HOSPITAL ROUTE MAP

APPENDIX A
POTENTIAL HEALTH EFFECTS FROM ON-SITE CONTAMINANTS

This fact sheet answers the most frequently asked health questions (FAQs) about arsenic. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to higher than average levels of arsenic occurs mostly in the workplace, near hazardous waste sites, or in areas with high natural levels. At high levels, inorganic arsenic can cause death. Exposure to lower levels for a long time can cause a discoloration of the skin and the appearance of small corns or warts. Arsenic has been found at 1,014 of the 1,598 National Priority List sites identified by the Environmental Protection Agency (EPA).

What is arsenic?

Arsenic is a naturally occurring element widely distributed in the earth's crust. In the environment, arsenic is combined with oxygen, chlorine, and sulfur to form inorganic arsenic compounds. Arsenic in animals and plants combines with carbon and hydrogen to form organic arsenic compounds.

Inorganic arsenic compounds are mainly used to preserve wood. Organic arsenic compounds are used as pesticides, primarily on cotton plants.

What happens to arsenic when it enters the environment?

- Arsenic cannot be destroyed in the environment. It can only change its form.
- Arsenic in air will settle to the ground or is washed out of the air by rain.
- Many arsenic compounds can dissolve in water.
- Fish and shellfish can accumulate arsenic, but the arsenic in fish is mostly in a form that is not harmful.

How might I be exposed to arsenic?

- Eating food, drinking water, or breathing air containing arsenic.
- Breathing contaminated workplace air.
- Breathing sawdust or burning smoke from wood treated with arsenic.
- Living near uncontrolled hazardous waste sites containing arsenic.
- Living in areas with unusually high natural levels of arsenic in rock.

How can arsenic affect my health?

Breathing high levels of inorganic arsenic can give you a sore throat or irritated lungs. Ingesting high levels of inorganic arsenic can result in death. Lower levels of arsenic can cause nausea and vomiting, decreased production of red and white blood cells, abnormal heart rhythm, damage to blood vessels, and a sensation of "pins and needles" in hands and feet.

Ingesting or breathing low levels of inorganic arsenic for a long time can cause a darkening of the skin and the

ToxFAQs™ Internet address is <http://www.atsdr.cdc.gov/toxfaq.html>

appearance of small “corns” or “warts” on the palms, soles, and torso.

Skin contact with inorganic arsenic may cause redness and swelling.

Organic arsenic compounds are less toxic than inorganic arsenic compounds. Exposure to high levels of some organic arsenic compounds may cause similar effects as inorganic arsenic.

How likely is arsenic to cause cancer?

Several studies have shown that inorganic arsenic can increase the risk of lung cancer, skin cancer, bladder cancer, liver cancer, kidney cancer, and prostate cancer. The World Health Organization (WHO), the Department of Health and Human Services (DHHS), and the EPA have determined that inorganic arsenic is a human carcinogen.

How can arsenic affect children?

We do not know if exposure to arsenic will result in birth defects or other developmental effects in people. Birth defects have been observed in animals exposed to inorganic arsenic.

It is likely that health effects seen in children exposed to high amounts of arsenic will be similar to the effects seen in adults.

How can families reduce the risk of exposure to arsenic?

- If you use arsenic-treated wood in home projects, you should wear dust masks, gloves, and protective clothing to decrease exposure to sawdust.
- If you live in an area with high levels of arsenic in water or soil, you should use cleaner sources of water and limit contact with soil.

Is there a medical test to show whether I've been exposed to arsenic?

There are tests to measure the level of arsenic in blood, urine, hair, or fingernails. The urine test is the most reliable test for arsenic exposure within the last few days. Tests on hair and fingernails can measure exposure to high levels of arsenic over the past 6-12 months. These tests can determine if you have been exposed to above-average levels of arsenic. They cannot predict how the arsenic levels in your body will affect your health.

Has the federal government made recommendations to protect human health?

EPA has set limits on the amount of arsenic that industrial sources can release to the environment and has restricted or canceled many uses of arsenic in pesticides. EPA has set a limit of 0.01 parts per million (ppm) for arsenic in drinking water.

The Occupational Safety and Health Administration has set limits of 10 µg arsenic per cubic meter of workplace air (10 µg/m³) for 8 hour shifts and 40 hour work weeks.

Source of Information

Agency for Toxic Substances and Disease Registry (ATSDR). 2000. Toxicological Profile for Arsenic. Atlanta, GA: U.S. Department of Health and Human Services, Public Health Service.

Where can I get more information? For more information, contact the Agency for Toxic Substances and Disease Registry, Division of Toxicology, 1600 Clifton Road NE, Mailstop F-32, Atlanta, GA 30333. Phone: 1-888-422-8737, FAX: 770-488-4178. ToxFAQs™ Internet address is <http://www.atsdr.cdc.gov/toxfaq.html>. ATSDR can tell you where to find occupational and environmental health clinics. Their specialists can recognize, evaluate, and treat illnesses resulting from exposure to hazardous substances. You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

This fact sheet answers the most frequently asked health questions (FAQs) about benzene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Benzene is a widely used chemical formed from both natural processes and human activities. Breathing benzene can cause drowsiness, dizziness, and unconsciousness; long-term benzene exposure causes effects on the bone marrow and can cause anemia and leukemia. Benzene has been found in at least 813 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is benzene?

(Pronounced bĕn'zĕn')

Benzene is a colorless liquid with a sweet odor. It evaporates into the air very quickly and dissolves slightly in water. It is highly flammable and is formed from both natural processes and human activities.

Benzene is widely used in the United States; it ranks in the top 20 chemicals for production volume. Some industries use benzene to make other chemicals which are used to make plastics, resins, and nylon and synthetic fibers. Benzene is also used to make some types of rubbers, lubricants, dyes, detergents, drugs, and pesticides. Natural sources of benzene include volcanoes and forest fires. Benzene is also a natural part of crude oil, gasoline, and cigarette smoke.

What happens to benzene when it enters the environment?

- Industrial processes are the main source of benzene in the environment.
- Benzene can pass into the air from water and soil.
- It reacts with other chemicals in the air and breaks down within a few days.
- Benzene in the air can attach to rain or snow and be carried back down to the ground.

- It breaks down more slowly in water and soil, and can pass through the soil into underground water.
- Benzene does not build up in plants or animals.

How might I be exposed to benzene?

- Outdoor air contains low levels of benzene from tobacco smoke, automobile service stations, exhaust from motor vehicles, and industrial emissions.
- Indoor air generally contains higher levels of benzene from products that contain it such as glues, paints, furniture wax, and detergents.
- Air around hazardous waste sites or gas stations will contain higher levels of benzene.
- Leakage from underground storage tanks or from hazardous waste sites containing benzene can result in benzene contamination of well water.
- People working in industries that make or use benzene may be exposed to the highest levels of it.
- A major source of benzene exposures is tobacco smoke.

How can benzene affect my health?

Breathing very high levels of benzene can result in death, while high levels can cause drowsiness, dizziness, rapid heart rate, headaches, tremors, confusion, and unconsciousness. Eating or drinking foods containing high levels of benzene can cause vomiting, irritation of the stomach, dizziness, sleepiness, convulsions, rapid heart rate, and death.

ToxFAQs Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaq.html>

The major effect of benzene from long-term (365 days or longer) exposure is on the blood. Benzene causes harmful effects on the bone marrow and can cause a decrease in red blood cells leading to anemia. It can also cause excessive bleeding and can affect the immune system, increasing the chance for infection.

Some women who breathed high levels of benzene for many months had irregular menstrual periods and a decrease in the size of their ovaries. It is not known whether benzene exposure affects the developing fetus in pregnant women or fertility in men.

Animal studies have shown low birth weights, delayed bone formation, and bone marrow damage when pregnant animals breathed benzene.

How likely is benzene to cause cancer?

The Department of Health and Human Services (DHHS) has determined that benzene is a known human carcinogen. Long-term exposure to high levels of benzene in the air can cause leukemia, cancer of the blood-forming organs.

Is there a medical test to show whether I've been exposed to benzene?

Several tests can show if you have been exposed to benzene. There is test for measuring benzene in the breath; this test must be done shortly after exposure. Benzene can also be measured in the blood, however, since benzene disappears rapidly from the blood, measurements are accurate only for recent exposures.

In the body, benzene is converted to products called metabolites. Certain metabolites can be measured in the urine. However, this test must be done shortly after exposure and is not a reliable indicator of how much benzene you have been exposed to, since the metabolites may be present in urine from other sources.

Has the federal government made recommendations to protect human health?

The EPA has set the maximum permissible level of benzene in drinking water at 0.005 milligrams per liter (0.005 mg/L). The EPA requires that spills or accidental releases into the environment of 10 pounds or more of benzene be reported to the EPA.

The Occupational Safety and Health Administration (OSHA) has set a permissible exposure limit of 1 part of benzene per million parts of air (1 ppm) in the workplace during an 8-hour workday, 40-hour workweek.

Glossary

Anemia: A decreased ability of the blood to transport oxygen.

Carcinogen: A substance with the ability to cause cancer.

CAS: Chemical Abstracts Service.

Chromosomes: Parts of the cells responsible for the development of hereditary characteristics.

Metabolites: Breakdown products of chemicals.

Milligram (mg): One thousandth of a gram.

Pesticide: A substance that kills pests.

Phone: 1-888-422-8737, FAX: 404-498-0093. ToxFAQs Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaq.html> ATSDR can tell you where to find occupational and environmental health clinics. Their specialists can recognize, evaluate, and treat illnesses resulting from exposure to hazardous substances. You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

This fact sheet answers the most frequently asked health questions (FAQs) about ethylbenzene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Ethylbenzene is a colorless liquid found in a number of products including gasoline and paints. Breathing very high levels can cause dizziness and throat and eye irritation. Ethylbenzene has been found in at least 731 of the 1,467 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is ethylbenzene?

(Pronounced ěth' əl bĕn' zĕn')

Ethylbenzene is a colorless, flammable liquid that smells like gasoline. It is found in natural products such as coal tar and petroleum and is also found in manufactured products such as inks, insecticides, and paints.

Ethylbenzene is used primarily to make another chemical, styrene. Other uses include as a solvent, in fuels, and to make other chemicals.

What happens to ethylbenzene when it enters the environment?

- Ethylbenzene moves easily into the air from water and soil.
- It takes about 3 days for ethylbenzene to be broken down in air into other chemicals.
- Ethylbenzene may be released to water from industrial discharges or leaking underground storage tanks.
- In surface water, ethylbenzene breaks down by reacting with other chemicals found naturally in water.
- In soil, it is broken down by soil bacteria.

How might I be exposed to ethylbenzene?

- Breathing air containing ethylbenzene, particularly in areas near factories or highways.
- Drinking contaminated tap water.
- Working in an industry where ethylbenzene is used or made.
- Using products containing it, such as gasoline, carpet glues, varnishes, and paints.

How can ethylbenzene affect my health?

Limited information is available on the effects of ethylbenzene on people's health. The available information shows dizziness, throat and eye irritation, tightening of the chest, and a burning sensation in the eyes of people exposed to high levels of ethylbenzene in air.

Animals studies have shown effects on the nervous system, liver, kidneys, and eyes from breathing ethylbenzene in air.

How likely is ethylbenzene to cause cancer?

The EPA has determined that ethylbenzene is not classified as to human carcinogenicity.

ToxFAQs Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaq.html>

No studies in people have shown that ethylbenzene exposure can result in cancer. Two available animal studies suggest that ethylbenzene may cause tumors.

How can ethylbenzene affect children?

Children may be exposed to ethylbenzene through inhalation of consumer products, including gasoline, paints, inks, pesticides, and carpet glue. We do not know whether children are more sensitive to the effects of ethylbenzene than adults.

It is not known whether ethylbenzene can affect the development of the human fetus. Animal studies have shown that when pregnant animals were exposed to ethylbenzene in air, their babies had an increased number of birth defects.

How can families reduce the risk of exposure to ethylbenzene?

Exposure to ethylbenzene vapors from household products and newly installed carpeting can be minimized by using adequate ventilation.

Household chemicals should be stored out of reach of children to prevent accidental poisoning. Always store household chemicals in their original containers; never store them in containers children would find attractive to eat or drink from, such as old soda bottles. Gasoline should be stored in a gasoline can with a locked cap.

Sometimes older children sniff household chemicals, including ethylbenzene, in an attempt to get high. Talk with your children about the dangers of sniffing chemicals.

Is there a medical test to show whether I've been exposed to ethylbenzene?

Ethylbenzene is found in the blood, urine, breath, and

some body tissues of exposed people. The most common way to test for ethylbenzene is in the urine. This test measures substances formed by the breakdown of ethylbenzene. This test needs to be done within a few hours after exposure occurs, because the substances leave the body very quickly.

These tests can show you were exposed to ethylbenzene, but cannot predict the kind of health effects that might occur.

Has the federal government made recommendations to protect human health?

The EPA has set a maximum contaminant level of 0.7 milligrams of ethylbenzene per liter of drinking water (0.7 mg/L).

The EPA requires that spills or accidental releases into the environment of 1,000 pounds or more of ethylbenzene be reported to the EPA.

The Occupational Safety and Health Administration (OSHA) has set an occupational exposure limit of 100 parts of ethylbenzene per million parts of air (100 ppm) for an 8-hour workday, 40-hour workweek.

References

Agency for Toxic Substances and Disease Registry (ATSDR). 1999. Toxicological profile for ethylbenzene. Atlanta, GA: U.S. Department of Health and Human Services, Public Health Service.

Where can I get more information? For more information, contact the Agency for Toxic Substances and Disease Registry, Division of Toxicology, 1600 Clifton Road NE, Mailstop F-32, Atlanta, GA 30333. Phone: 1-888-422-8737, FAX: 770-488-4178. ToxFAQs Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaq.html> ATSDR can tell you where to find occupational and environmental health clinics. Their specialists can recognize, evaluate, and treat illnesses resulting from exposure to hazardous substances. You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

This fact sheet answers the most frequently asked health questions (FAQs) about fuel oils. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Fuel oils are liquid mixtures produced from petroleum, and their use mostly involves burning them as fuels. Drinking or breathing fuel oils may cause nausea or nervous system effects. However, exposure under normal use conditions is not likely to be harmful. Fuel oils have been found in at least 26 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are fuel oils?

(Pronounced fyoo'el oilz)

Fuel oils are a variety of yellowish to light brown liquid mixtures that come from crude petroleum. Some chemicals found in fuel oils may evaporate easily, while others may more easily dissolve in water.

Fuel oils are produced by different petroleum refining processes, depending on their intended uses. Fuel oils may be used as fuel for engines, lamps, heaters, furnaces, and stoves, or as solvents.

Some commonly found fuel oils include kerosene, diesel fuel, jet fuel, range oil, and home heating oil. These fuel oils differ from one another by their hydrocarbon compositions, boiling point ranges, chemical additives, and uses.

What happens to fuel oils when they enter the environment?

- Some chemicals found in fuel oils may evaporate into the air from open containers or contaminated soil or water.
- Some chemicals found in fuel oils may dissolve in water after spills to surface waters or leaks from underground storage tanks.

- Some chemicals found in fuel oils may stick to particles in water, which will eventually cause them to settle to the bottom sediment.
- Some of the chemicals found in fuel oils may be broken down slowly in air, water, and soil by sunlight or small organisms.
- Some of the chemicals found in fuel oils may build up significantly in plants and animals.

How might I be exposed to fuel oils?

- Using a home kerosene heater or stove, or using fuel oils at work.
- Breathing air in home or building basements that has been contaminated with fuel oil vapors entering from the soil.
- Drinking or swimming in water that has been contaminated with fuel oils from a spill or a leaking underground storage tank.
- Touching soil contaminated with fuel oils.
- Using fuel oils to wash paint or grease from skin or equipment.

How can fuel oils affect my health?

Little information is available about the health effects that may be caused by fuel oils. People who use kerosene

ToxFAQs Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaq.html>

stoves for cooking do not seem to have any health problems related to their exposure.

Breathing some fuel oils for short periods may cause nausea, eye irritation, increased blood pressure, headache, lightheadedness, loss of appetite, poor coordination, and difficulty concentrating. Breathing diesel fuel vapors for long periods may cause kidney damage and lower your blood's ability to clot.

Drinking small amounts of kerosene may cause vomiting, diarrhea, coughing, stomach swelling and cramps, drowsiness, restlessness, painful breathing, irritability, and unconsciousness. Drinking large amounts of kerosene may cause convulsions, coma, or death. Skin contact with kerosene for short periods may cause itchy, red, sore, or peeling skin.

How likely are fuel oils to cause cancer?

The International Agency for Research on Cancer (IARC) has determined that some fuel oils (heavy) may possibly cause cancer in humans, but for other fuel oils (light) there is not enough information to make a determination. IARC has also determined that occupational exposures to fuel oils during petroleum refining are probably carcinogenic in humans.

Some studies with mice have suggested that repeated contact with fuel oils may cause liver or skin cancer. However, other mouse studies have found this not to be the case. No studies are available in other animals or in people on the carcinogenic effects of fuel oils.

Is there a medical test to show whether I've been exposed to fuel oils?

There is no medical test that shows if you have been exposed to fuel oils. Tests are available to determine if some of

the chemicals commonly found in fuel oils are in your blood. However, the presence of these chemicals in blood may not necessarily mean that you have been exposed to fuel oils.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) and the Air Force Office of Safety and Health (AFOSH) have set a permissible exposure level (PEL) of 400 parts of petroleum distillates per million parts of air (400 ppm) for an 8-hour workday, 40-hour workweek.

The National Institute for Occupational Safety and Health (NIOSH) recommends that average workplace air levels not exceed 350 milligrams of petroleum distillates per cubic meter of air (350 mg/m³) for a 40-hour workweek.

The Department of Transportation (DOT) lists fuel oils as hazardous materials and, therefore, regulates their transportation.

Glossary

Carcinogenic: Able to cause cancer.

CAS: Chemical Abstracts Service.

Evaporate: To change into a vapor or a gas.

Hydrocarbon: Any compound made up of hydrogen and carbon.

Milligram (mg): One thousandth of a gram.

ppm: Parts per million.

Sediment: Mud and debris that have settled to the bottom of a body of water.

Where can I get more information? For more information, contact the Agency for Toxic Substances and Disease Registry, Division of Toxicology, 1600 Clifton Road NE, Mailstop E-29, Atlanta, GA 30333. Phone: 1-888-422-8737, FAX: 404-498-0093. ToxFAQs Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaq.html> ATSDR can tell you where to find occupational and environmental health clinics. Their specialists can recognize, evaluate, and treat illnesses resulting from exposure to hazardous substances. You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

This fact sheet answers the most frequently asked health questions (FAQs) about lead. For more information, call the ATSDR Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to lead can happen from breathing workplace air or dust, eating contaminated foods, or drinking contaminated water. Children can be exposed from eating lead-based paint chips or playing in contaminated soil. Lead can damage the nervous system, kidneys, and reproductive system. Lead has been found in at least 1,272 of the 1,684 National Priority List sites identified by the Environmental Protection Agency (EPA).

What is lead?

Lead is a naturally occurring bluish-gray metal found in small amounts in the earth's crust. Lead can be found in all parts of our environment. Much of it comes from human activities including burning fossil fuels, mining, and manufacturing.

Lead has many different uses. It is used in the production of batteries, ammunition, metal products (solder and pipes), and devices to shield X-rays. Because of health concerns, lead from paints and ceramic products, caulking, and pipe solder has been dramatically reduced in recent years. The use of lead as an additive to gasoline was banned in 1996 in the United States.

What happens to lead when it enters the environment?

- Lead itself does not break down, but lead compounds are changed by sunlight, air, and water.
- When lead is released to the air, it may travel long distances before settling to the ground.
- Once lead falls onto soil, it usually sticks to soil particles.
- Movement of lead from soil into groundwater will depend on the type of lead compound and the characteristics of the soil.

How might I be exposed to lead?

- Eating food or drinking water that contains lead. Water pipes in some older homes may contain lead solder. Lead can leach out into the water.

- Spending time in areas where lead-based paints have been used and are deteriorating. Deteriorating lead paint can contribute to lead dust.

- Working in a job where lead is used or engaging in certain hobbies in which lead is used, such as making stained glass.

- Using health-care products or folk remedies that contain lead.

How can lead affect my health?

The effects of lead are the same whether it enters the body through breathing or swallowing. Lead can affect almost every organ and system in your body. The main target for lead toxicity is the nervous system, both in adults and children. Long-term exposure of adults can result in decreased performance in some tests that measure functions of the nervous system. It may also cause weakness in fingers, wrists, or ankles. Lead exposure also causes small increases in blood pressure, particularly in middle-aged and older people and can cause anemia. Exposure to high lead levels can severely damage the brain and kidneys in adults or children and ultimately cause death. In pregnant women, high levels of exposure to lead may cause miscarriage. High-level exposure in men can damage the organs responsible for sperm production.

How likely is lead to cause cancer?

We have no conclusive proof that lead causes cancer in humans. Kidney tumors have developed in rats and mice that had been given large doses of some kind of lead compounds. The Department of Health and Human Services

ToxFAQs™ Internet address is <http://www.atsdr.cdc.gov/toxfaq.html>

(DHHS) has determined that lead and lead compounds are reasonably anticipated to be human carcinogens and the EPA has determined that lead is a probable human carcinogen. The International Agency for Research on Cancer (IARC) has determined that inorganic lead is probably carcinogenic to humans and that there is insufficient information to determine whether organic lead compounds will cause cancer in humans.

How can lead affect children?

Small children can be exposed by eating lead-based paint chips, chewing on objects painted with lead-based paint, or swallowing house dust or soil that contains lead.

Children are more vulnerable to lead poisoning than adults. A child who swallows large amounts of lead may develop blood anemia, severe stomachache, muscle weakness, and brain damage. If a child swallows smaller amounts of lead, much less severe effects on blood and brain function may occur. Even at much lower levels of exposure, lead can affect a child's mental and physical growth.

Exposure to lead is more dangerous for young and unborn children. Unborn children can be exposed to lead through their mothers. Harmful effects include premature births, smaller babies, decreased mental ability in the infant, learning difficulties, and reduced growth in young children. These effects are more common if the mother or baby was exposed to high levels of lead. Some of these effects may persist beyond childhood.

How can families reduce the risks of exposure to lead?

- Avoid exposure to sources of lead.
- Do not allow children to chew on mouth surfaces that may have been painted with lead-based paint.
- If you have a water lead problem, run or flush water that has been standing overnight before drinking or cooking with it.
- Some types of paints and pigments that are used as make-up or hair coloring contain lead. Keep these kinds of products away from children
- If your home contains lead-based paint or you live in an area contaminated with lead, wash children's hands and faces

often to remove lead dusts and soil, and regularly clean the house of dust and tracked in soil.

Is there a medical test to determine whether I've been exposed to lead?

A blood test is available to measure the amount of lead in your blood and to estimate the amount of your recent exposure to lead. Blood tests are commonly used to screen children for lead poisoning. Lead in teeth or bones can be measured by X-ray techniques, but these methods are not widely available. Exposure to lead also can be evaluated by measuring erythrocyte protoporphyrin (EP) in blood samples. EP is a part of red blood cells known to increase when the amount of lead in the blood is high. However, the EP level is not sensitive enough to identify children with elevated blood lead levels below about 25 micrograms per deciliter ($\mu\text{g}/\text{dL}$). These tests usually require special analytical equipment that is not available in a doctor's office. However, your doctor can draw blood samples and send them to appropriate laboratories for analysis.

Has the federal government made recommendations to protect human health?

The Centers for Disease Control and Prevention (CDC) recommends that states test children at ages 1 and 2 years. Children should be tested at ages 3–6 years if they have never been tested for lead, if they receive services from public assistance programs for the poor such as Medicaid or the Supplemental Food Program for Women, Infants, and Children, if they live in a building or frequently visit a house built before 1950; if they visit a home (house or apartment) built before 1978 that has been recently remodeled; and/or if they have a brother, sister, or playmate who has had lead poisoning. CDC considers a blood lead level of 10 $\mu\text{g}/\text{dL}$ to be a level of concern for children.

EPA limits lead in drinking water to 15 μg per liter.

This fact sheet answers the most frequently asked health questions (FAQs) about mercury. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to mercury occurs from breathing contaminated air, ingesting contaminated water and food, and having dental and medical treatments. Mercury, at high levels, may damage the brain, kidneys, and developing fetus. This chemical has been found in at least 714 of 1,467 National Priorities List sites identified by the Environmental Protection Agency.

What is mercury?

(Pronounced mŭr/kyə-rē)

Mercury is a naturally occurring metal which has several forms. The metallic mercury is a shiny, silver-white, odorless liquid. If heated, it is a colorless, odorless gas.

Mercury combines with other elements, such as chlorine, sulfur, or oxygen, to form inorganic mercury compounds or "salts," which are usually white powders or crystals. Mercury also combines with carbon to make organic mercury compounds. The most common one, methylmercury, is produced mainly by microscopic organisms in the water and soil. More mercury in the environment can increase the amounts of methylmercury that these small organisms make.

Metallic mercury is used to produce chlorine gas and caustic soda, and is also used in thermometers, dental fillings, and batteries. Mercury salts are sometimes used in skin lightening creams and as antiseptic creams and ointments.

What happens to mercury when it enters the environment?

- Inorganic mercury (metallic mercury and inorganic mercury compounds) enters the air from mining ore deposits, burning coal and waste, and from manufacturing plants.
- It enters the water or soil from natural deposits, disposal of wastes, and volcanic activity.

- Methylmercury may be formed in water and soil by small organisms called bacteria.
- Methylmercury builds up in the tissues of fish. Larger and older fish tend to have the highest levels of mercury.

How might I be exposed to mercury?

- Eating fish or shellfish contaminated with methylmercury.
- Breathing vapors in air from spills, incinerators, and industries that burn mercury-containing fuels.
- Release of mercury from dental work and medical treatments.
- Breathing contaminated workplace air or skin contact during use in the workplace (dental, health services, chemical, and other industries that use mercury).
- Practicing rituals that include mercury.

How can mercury affect my health?

The nervous system is very sensitive to all forms of mercury. Methylmercury and metallic mercury vapors are more harmful than other forms, because more mercury in these forms reaches the brain. Exposure to high levels of metallic, inorganic, or organic mercury can permanently damage the brain, kidneys, and developing fetus. Effects on brain functioning may result in irritability, shyness, tremors, changes in vision or hearing, and memory problems.

Short-term exposure to high levels of metallic mercury vapors may cause effects including lung damage, nausea,

ToxFAQs Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaq.html>

vomiting, diarrhea, increases in blood pressure or heart rate, skin rashes, and eye irritation.

How likely is mercury to cause cancer?

There are inadequate human cancer data available for all forms of mercury. Mercuric chloride has caused increases in several types of tumors in rats and mice, and methylmercury has caused kidney tumors in male mice. The EPA has determined that mercuric chloride and methylmercury are possible human carcinogens.

How can mercury affect children?

Very young children are more sensitive to mercury than adults. Mercury in the mother's body passes to the fetus and may accumulate there. It can also pass to a nursing infant through breast milk. However, the benefits of breast feeding may be greater than the possible adverse effects of mercury in breast milk.

Mercury's harmful effects that may be passed from the mother to the fetus include brain damage, mental retardation, incoordination, blindness, seizures, and inability to speak. Children poisoned by mercury may develop problems of their nervous and digestive systems, and kidney damage.

How can families reduce the risk of exposure to mercury?

Carefully handle and dispose of products that contain mercury, such as thermometers or fluorescent light bulbs. Do not vacuum up spilled mercury, because it will vaporize and increase exposure. If a large amount of mercury has been spilled, contact your health department. Teach children not to play with shiny, silver liquids.

Properly dispose of older medicines that contain mercury. Keep all mercury-containing medicines away from children.

Pregnant women and children should keep away from

rooms where liquid mercury has been used.

Learn about wildlife and fish advisories in your area from your public health or natural resources department.

Is there a medical test to show whether I've been exposed to mercury?

Tests are available to measure mercury levels in the body. Blood or urine samples are used to test for exposure to metallic mercury and to inorganic forms of mercury. Mercury in whole blood or in scalp hair is measured to determine exposure to methylmercury. Your doctor can take samples and send them to a testing laboratory.

Has the federal government made recommendations to protect human health?

The EPA has set a limit of 2 parts of mercury per billion parts of drinking water (2 ppb).

The Food and Drug Administration (FDA) has set a maximum permissible level of 1 part of methylmercury in a million parts of seafood (1 ppm).

The Occupational Safety and Health Administration (OSHA) has set limits of 0.1 milligram of organic mercury per cubic meter of workplace air (0.1 mg/m³) and 0.05 mg/m³ of metallic mercury vapor for 8-hour shifts and 40-hour work weeks.

This fact sheet answers the most frequently asked health questions (FAQs) about polycyclic aromatic hydrocarbons (PAHs). For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Exposure to polycyclic aromatic hydrocarbons usually occurs by breathing air contaminated by wild fires or coal tar, or by eating foods that have been grilled. PAHs have been found in at least 600 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are polycyclic aromatic hydrocarbons?

(Pronounced pŏl'ī-sī'klīk ār'ə-măt'īk hī'drə-kar'bənz)

Polycyclic aromatic hydrocarbons (PAHs) are a group of over 100 different chemicals that are formed during the incomplete burning of coal, oil and gas, garbage, or other organic substances like tobacco or charbroiled meat. PAHs are usually found as a mixture containing two or more of these compounds, such as soot.

Some PAHs are manufactured. These pure PAHs usually exist as colorless, white, or pale yellow-green solids. PAHs are found in coal tar, crude oil, creosote, and roofing tar, but a few are used in medicines or to make dyes, plastics, and pesticides.

What happens to PAHs when they enter the environment?

- PAHs enter the air mostly as releases from volcanoes, forest fires, burning coal, and automobile exhaust.
- PAHs can occur in air attached to dust particles.
- Some PAH particles can readily evaporate into the air from soil or surface waters.
- PAHs can break down by reacting with sunlight and other chemicals in the air, over a period of days to weeks.

- PAHs enter water through discharges from industrial and wastewater treatment plants.
- Most PAHs do not dissolve easily in water. They stick to solid particles and settle to the bottoms of lakes or rivers.
- Microorganisms can break down PAHs in soil or water after a period of weeks to months.
- In soils, PAHs are most likely to stick tightly to particles; certain PAHs move through soil to contaminate underground water.
- PAH contents of plants and animals may be much higher than PAH contents of soil or water in which they live.

How might I be exposed to PAHs?

- Breathing air containing PAHs in the workplace of coking, coal-tar, and asphalt production plants; smoke-houses; and municipal trash incineration facilities.
- Breathing air containing PAHs from cigarette smoke, wood smoke, vehicle exhausts, asphalt roads, or agricultural burn smoke.
- Coming in contact with air, water, or soil near hazardous waste sites.
- Eating grilled or charred meats; contaminated cereals, flour, bread, vegetables, fruits, meats; and processed or pickled foods.
- Drinking contaminated water or cow's milk.

ToxFAQs Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaq.html>

- ❑ Nursing infants of mothers living near hazardous waste sites may be exposed to PAHs through their mother's milk.

How can PAHs affect my health?

Mice that were fed high levels of one PAH during pregnancy had difficulty reproducing and so did their offspring. These offspring also had higher rates of birth defects and lower body weights. It is not known whether these effects occur in people.

Animal studies have also shown that PAHs can cause harmful effects on the skin, body fluids, and ability to fight disease after both short- and long-term exposure. But these effects have not been seen in people.

How likely are PAHs to cause cancer?

The Department of Health and Human Services (DHHS) has determined that some PAHs may reasonably be expected to be carcinogens.

Some people who have breathed or touched mixtures of PAHs and other chemicals for long periods of time have developed cancer. Some PAHs have caused cancer in laboratory animals when they breathed air containing them (lung cancer), ingested them in food (stomach cancer), or had them applied to their skin (skin cancer).

Is there a medical test to show whether I've been exposed to PAHs?

In the body, PAHs are changed into chemicals that can attach to substances within the body. There are special tests that can detect PAHs attached to these substances in body tissues or blood. However, these tests cannot tell whether any

health effects will occur or find out the extent or source of your exposure to the PAHs. The tests aren't usually available in your doctor's office because special equipment is needed to conduct them.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) has set a limit of 0.2 milligrams of PAHs per cubic meter of air (0.2 mg/m^3). The OSHA Permissible Exposure Limit (PEL) for mineral oil mist that contains PAHs is 5 mg/m^3 averaged over an 8-hour exposure period.

The National Institute for Occupational Safety and Health (NIOSH) recommends that the average workplace air levels for coal tar products not exceed 0.1 mg/m^3 for a 10-hour workday, within a 40-hour workweek. There are other limits for workplace exposure for things that contain PAHs, such as coal, coal tar, and mineral oil.

Glossary

Carcinogen: A substance that can cause cancer.

Ingest: Take food or drink into your body.

References

Where can I get more information? For more information, contact the Agency for Toxic Substances and Disease Registry, Division of Toxicology, 1600 Clifton Road NE, Mailstop E-29, Atlanta, GA 30333. Phone: 1-888-422-8737, FAX: 404-498-0093. ToxFAQs Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaq.html> ATSDR can tell you where to find occupational and environmental health clinics. Their specialists can recognize, evaluate, and treat illnesses resulting from exposure to hazardous substances. You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

This fact sheet answers the most frequently asked health questions (FAQs) about trichloroethylene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Trichloroethylene is a colorless liquid which is used as a solvent for cleaning metal parts. Drinking or breathing high levels of trichloroethylene may cause nervous system effects, liver and lung damage, abnormal heartbeat, coma, and possibly death. Trichloroethylene has been found in at least 852 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is trichloroethylene?

Trichloroethylene (TCE) is a nonflammable, colorless liquid with a somewhat sweet odor and a sweet, burning taste. It is used mainly as a solvent to remove grease from metal parts, but it is also an ingredient in adhesives, paint removers, typewriter correction fluids, and spot removers.

Trichloroethylene is not thought to occur naturally in the environment. However, it has been found in underground water sources and many surface waters as a result of the manufacture, use, and disposal of the chemical.

What happens to trichloroethylene when it enters the environment?

- ❑ Trichloroethylene dissolves a little in water, but it can remain in ground water for a long time.
- ❑ Trichloroethylene quickly evaporates from surface water, so it is commonly found as a vapor in the air.
- ❑ Trichloroethylene evaporates less easily from the soil than from surface water. It may stick to particles and remain for a long time.
- ❑ Trichloroethylene may stick to particles in water, which will cause it to eventually settle to the bottom sediment.
- ❑ Trichloroethylene does not build up significantly in

plants and animals.

How might I be exposed to trichloroethylene?

- ❑ Breathing air in and around the home which has been contaminated with trichloroethylene vapors from shower water or household products such as spot removers and typewriter correction fluid.
- ❑ Drinking, swimming, or showering in water that has been contaminated with trichloroethylene.
- ❑ Contact with soil contaminated with trichloroethylene, such as near a hazardous waste site.
- ❑ Contact with the skin or breathing contaminated air while manufacturing trichloroethylene or using it at work to wash paint or grease from skin or equipment.

How can trichloroethylene affect my health?

Breathing small amounts may cause headaches, lung irritation, dizziness, poor coordination, and difficulty concentrating.

Breathing large amounts of trichloroethylene may cause impaired heart function, unconsciousness, and death. Breathing it for long periods may cause nerve, kidney, and liver damage.

ToxFAQs™ Internet address is <http://www.atsdr.cdc.gov/toxfaq.html>

Drinking large amounts of trichloroethylene may cause nausea, liver damage, unconsciousness, impaired heart function, or death.

Drinking small amounts of trichloroethylene for long periods may cause liver and kidney damage, impaired immune system function, and impaired fetal development in pregnant women, although the extent of some of these effects is not yet clear.

Skin contact with trichloroethylene for short periods may cause skin rashes.

How likely is trichloroethylene to cause cancer?

Some studies with mice and rats have suggested that high levels of trichloroethylene may cause liver, kidney, or lung cancer. Some studies of people exposed over long periods to high levels of trichloroethylene in drinking water or in workplace air have found evidence of increased cancer. Although, there are some concerns about the studies of people who were exposed to trichloroethylene, some of the effects found in people were similar to effects in animals.

In its 9th Report on Carcinogens, the National Toxicology Program (NTP) determined that trichloroethylene is “reasonably anticipated to be a human carcinogen.” The International Agency for Research on Cancer (IARC) has determined that trichloroethylene is “probably carcinogenic to humans.”

Is there a medical test to show whether I've been exposed to trichloroethylene?

If you have recently been exposed to trichloroethylene, it can be detected in your breath, blood, or urine. The breath test, if it is performed soon after exposure, can tell if you have been exposed to even a small amount of trichloroethylene.

Exposure to larger amounts is assessed by blood

and urine tests, which can detect trichloroethylene and many of its breakdown products for up to a week after exposure. However, exposure to other similar chemicals can produce the same breakdown products, so their detection is not absolute proof of exposure to trichloroethylene. This test isn't available at most doctors' offices, but can be done at special laboratories that have the right equipment.

Has the federal government made recommendations to protect human health?

The EPA has set a maximum contaminant level for trichloroethylene in drinking water at 0.005 milligrams per liter (0.005 mg/L) or 5 parts of TCE per billion parts water.

The EPA has also developed regulations for the handling and disposal of trichloroethylene.

The Occupational Safety and Health Administration (OSHA) has set an exposure limit of 100 parts of trichloroethylene per million parts of air (100 ppm) for an 8-hour workday, 40-hour workweek.

Glossary

Carcinogenicity: The ability of a substance to cause cancer.

CAS: Chemical Abstracts Service.

Evaporate: To change into a vapor or gas.

Milligram (mg): One thousandth of a gram.

Nonflammable: Will not burn.

ppm: Parts per million.

Sediment: Mud and debris that have settled to the bottom of a body of water.

Solvent: A chemical that dissolves other substances.

This ToxFAQs information is taken from the 1997 Toxicological Profile for Trichloroethylene (update) produced by the Agency for Toxic Substances and Disease Registry, Public Health Service, U.S. Department of Health and Human Services, Public Health Service in Atlanta, GA.

Where can I get more information? For more information, contact the Agency for Toxic Substances and Disease Registry, Division of Toxicology, 1600 Clifton Road NE, Mailstop F-32, Atlanta, GA 30333. Phone: 1-888-422-8737, FAX: 770-488-4178. ToxFAQs™ Internet address is <http://www.atsdr.cdc.gov/toxfaq.html>. ATSDR can tell you where to find occupational and environmental health clinics. Their specialists can recognize, evaluate, and treat illnesses resulting from exposure to hazardous substances. You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

This fact sheet answers the most frequently asked health questions (FAQs) about toluene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to toluene occurs from breathing contaminated workplace air, in automobile exhaust, some consumer products paints, paint thinners, fingernail polish, lacquers, and adhesives. Toluene affects the nervous system. Toluene has been found at 959 of the 1,591 National Priority List sites identified by the Environmental Protection Agency

What is toluene?

Toluene is a clear, colorless liquid with a distinctive smell. Toluene occurs naturally in crude oil and in the tolu tree. It is also produced in the process of making gasoline and other fuels from crude oil and making coke from coal.

Toluene is used in making paints, paint thinners, fingernail polish, lacquers, adhesives, and rubber and in some printing and leather tanning processes.

What happens to toluene when it enters the environment?

Toluene enters the environment when you use materials that contain it. It can also enter surface water and groundwater from spills of solvents and petroleum products as well as from leaking underground storage tanks at gasoline stations and other facilities.

When toluene-containing products are placed in landfills or waste disposal sites, the toluene can enter the soil or water near the waste site.

Toluene does not usually stay in the environment long.

Toluene does not concentrate or buildup to high levels in animals.

How might I be exposed to toluene?

Breathing contaminated workplace air or automobile exhaust.

Working with gasoline, kerosene, heating oil, paints, and lacquers.

Drinking contaminated well-water.

Living near uncontrolled hazardous waste sites containing toluene products.

How can toluene affect my health?

Toluene may affect the nervous system. Low to moderate levels can cause tiredness, confusion, weakness, drunken-type actions, memory loss, nausea, loss of appetite, and

ToxFAQs™ Internet address is <http://www.atsdr.cdc.gov/toxfaq.html>

hearing and color vision loss. These symptoms usually disappear when exposure is stopped.

Inhaling High levels of toluene in a short time can make you feel light-headed, dizzy, or sleepy. It can also cause unconsciousness, and even death.

High levels of toluene may affect your kidneys.

How likely is toluene to cause cancer?

Studies in humans and animals generally indicate that toluene does not cause cancer.

The EPA has determined that the carcinogenicity of toluene can not be classified.

How can toluene affect children?

It is likely that health effects seen in children exposed to toluene will be similar to the effects seen in adults. Some studies in animals suggest that babies may be more sensitive than adults.

Breathing very high levels of toluene during pregnancy can result in children with birth defects and retard mental abilities, and growth. We do not know if toluene harms the unborn child if the mother is exposed to low levels of toluene during pregnancy.

How can families reduce the risk of exposure to toluene?

- Use toluene-containing products in well-ventilated areas.

- When not in use, toluene-containing products should be tightly covered to prevent evaporation into the air.

Is there a medical test to show whether I've been exposed to toluene?

There are tests to measure the level of toluene or its breakdown products in exhaled air, urine, and blood. To determine if you have been exposed to toluene, your urine or blood must be checked within 12 hours of exposure. Several other chemicals are also changed into the same breakdown products as toluene, so some of these tests are not specific for toluene.

Has the federal government made recommendations to protect human health?

EPA has set a limit of 1 milligram per liter of drinking water (1 mg/L).

Discharges, releases, or spills of more than 1,000 pounds of toluene must be reported to the National Response Center.

The Occupational Safety and Health Administration has set a limit of 200 parts toluene per million of workplace air (200 ppm).

You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

This fact sheet answers the most frequently asked health questions (FAQs) about xylene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Exposure to xylene occurs in the workplace and when you use paint, gasoline, paint thinners and other products that contain it. People who breathe high levels may have dizziness, confusion, and a change in their sense of balance. This substance has been found in at least 658 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is xylene?

(Pronounced zī'lēn)

Xylene is a colorless, sweet-smelling liquid that catches on fire easily. It occurs naturally in petroleum and coal tar and is formed during forest fires. You can smell xylene in air at 0.08–3.7 parts of xylene per million parts of air (ppm) and begin to taste it in water at 0.53–1.8 ppm.

Chemical industries produce xylene from petroleum. It's one of the top 30 chemicals produced in the United States in terms of volume.

Xylene is used as a solvent and in the printing, rubber, and leather industries. It is also used as a cleaning agent, a thinner for paint, and in paints and varnishes. It is found in small amounts in airplane fuel and gasoline.

What happens to xylene when it enters the environment?

- Xylene has been found in waste sites and landfills when discarded as used solvent, or in varnish, paint, or paint thinners.
- It evaporates quickly from the soil and surface water into the air.

- In the air, it is broken down by sunlight into other less harmful chemicals.
- It is broken down by microorganisms in soil and water.
- Only a small amount of it builds up in fish, shellfish, plants, and animals living in xylene-contaminated water.

How might I be exposed to xylene?

- Breathing xylene in workplace air or in automobile exhaust.
- Breathing contaminated air.
- Touching gasoline, paint, paint removers, varnish, shellac, and rust preventatives that contain it.
- Breathing cigarette smoke that has small amounts of xylene in it.
- Drinking contaminated water or breathing air near waste sites and landfills that contain xylene.
- The amount of xylene in food is likely to be low.

How can xylene affect my health?

Xylene affects the brain. High levels from exposure for short periods (14 days or less) or long periods (more than 1 year) can cause headaches, lack of muscle coordination, dizziness, confusion, and changes in one's sense of balance. Exposure of

ToxFAQs Internet home page via WWW is <http://www.atsdr.cdc.gov/toxfaq.html>

people to high levels of xylene for short periods can also cause irritation of the skin, eyes, nose, and throat; difficulty in breathing; problems with the lungs; delayed reaction time; memory difficulties; stomach discomfort; and possibly changes in the liver and kidneys. It can cause unconsciousness and even death at very high levels.

Studies of unborn animals indicate that high concentrations of xylene may cause increased numbers of deaths, and delayed growth and development. In many instances, these same concentrations also cause damage to the mothers. We do not know if xylene harms the unborn child if the mother is exposed to low levels of xylene during pregnancy.

How likely is xylene to cause cancer?

The International Agency for Research on Cancer (IARC) has determined that xylene is not classifiable as to its carcinogenicity in humans.

Human and animal studies have not shown xylene to be carcinogenic, but these studies are not conclusive and do not provide enough information to conclude that xylene does not cause cancer.

Is there a medical test to show whether I've been exposed to xylene?

Laboratory tests can detect xylene or its breakdown products in exhaled air, blood, or urine. There is a high degree of agreement between the levels of exposure to xylene and the levels of xylene breakdown products in the urine. However, a urine sample must be provided very soon after exposure ends because xylene quickly leaves the body. These tests are not routinely available at your doctor's office.

Has the federal government made recommendations to protect human health?

The EPA has set a limit of 10 ppm of xylene in drinking water.

The EPA requires that spills or accidental releases of xylenes into the environment of 1,000 pounds or more must be reported.

The Occupational Safety and Health Administration (OSHA) has set a maximum level of 100 ppm xylene in workplace air for an 8-hour workday, 40-hour workweek.

The National Institute for Occupational Safety and Health (NIOSH) and the American Conference of Governmental Industrial Hygienists (ACGIH) also recommend exposure limits of 100 ppm in workplace air.

NIOSH has recommended that 900 ppm of xylene be considered immediately dangerous to life or health. This is the exposure level of a chemical that is likely to cause permanent health problems or death.

Glossary

Evaporate: To change from a liquid into a vapor or a gas.

Carcinogenic: Having the ability to cause cancer.

CAS: Chemical Abstracts Service.

ppm: Parts per million.

Solvent: A liquid that can dissolve other substances.

APPENDIX C
EMERGENCY HAND SIGNALS

EMERGENCY SIGNALS

In most cases, field personnel will carry portable radios for communication. If this is the case, a transmission that indicates an emergency will take priority over all other transmissions. All other site radios will yield the frequency to the emergency transmissions.

Where radio communications is not available, the following air-horn and/or hand signals will be used:

EMERGENCY HAND SIGNALS

OUT OF AIR, CAN'T BREATHE!

Hand gripping throat

**LEAVE AREA IMMEDIATELY,
NO DEBATE!**

(No Picture) Grip partner's wrist or place both hands around waist

NEED ASSISTANCE!

Hands on top of head

OKAY! – I'M ALL RIGHT!

- I UNDERSTAND!

Thumbs up

NO! - NEGATIVE!

Thumbs down

**APPENDIX E-5:
AMNH Asbestos Management Plan**

THE AMERICAN MUSEUM OF NATURAL HISTORY

ASBESTOS MANAGEMENT

Purpose

The purpose of this plan is to facilitate the proper management of asbestos containing building materials present within the Museum, to minimize employee exposure to asbestos containing material and to ensure that the Museum is in compliance with all applicable regulations pertaining to asbestos.

1. SCOPE

- a. This standard operating procedure provides a structured approach to managing asbestos-containing building materials during renovations, improvements, and general maintenance that will be conducted at the Museum.

2. DEFINITIONS

- a. Asbestos containing materials - Refers to products that contain greater than one percent by weight and volume asbestos. These may include, but are not limited to, pipe insulation, floor and ceiling tiles, spray applied fireproofing, etc.
- b. Demolition - The wrecking or taking out of any load-supporting structural member of a facility together with any related handling operations or the intentional burning of any facility.
- c. Renovation – The altering a facility or one or more facility components in any way, including the stripping or removal of regulated asbestos-containing material (RACM) from a facility component.
- d. Construction - Work for erection, alteration, and/or repair, including painting and decorating.

3. GENERAL

- a. Management of Asbestos Program:
 - i. No employee of the Museum should impact or conduct removal of asbestos. An asbestos licensed contractor must conduct all asbestos abatements or encapsulations.
 - ii. The handling of asbestos shall be in accordance with 29 CFR 1910.1001 and 1926.1101 (OSHA), 12 NYCRR Part 56 (New York State) and 15 NYCRR Chapter 1 (New York City).
 - iii. Only New York State/New York City licensed personnel may handle ACM or suspect ACM.
 - iv. The EHS (Safety) Director is responsible for managing the Asbestos Management Program at the Museum. The EHS Director should be notified in the following situations:
 1. Prior to planned renovations where asbestos removal or encapsulation is necessary.
 2. Prior to “Large”, “Small” or “Minor” Projects conducted by an asbestos contractor.
 3. In the event of an emergency that may involve ACM (water pipe break, fire, etc.)

4. If there are any questions as to the presence of ACM
5. If there are any questions pertaining to asbestos

4. TRAINING

- a. Asbestos awareness training will be conducted with the applicable departments.

5. NOTIFICATION

- a. Notifications for asbestos containing material will occur in the form of postings which outline all known asbestos locations within the Museum. This listing will be posted in all Facilities departments as well as the Lamping department.
- b. Postings for employees and contractors will be on a bulletin board near the employee cafeteria located in Section 3, Lower Level.
- c. A posting will also occur in or near the actual abatement in accordance with regulations.
- d. Notifications of planned asbestos removal as early as possible but no later than 10 days prior to the project and include the following information:
 - i. Contractor, project location, size, amount, type of ACM, abatement procedure, dates of expected occurrence, and Call Center "311" for government information and services.
- e. Notifications of an emergency asbestos removal will occur as soon as practicable after identification of the project

6. HANDLING

- a. The handling of asbestos shall be in accordance with 29 CFR 1925.1101 (OSHA), 12 NYCRR Part 56 (New York State) and 15 NYCRR Chapter 1 (New York City). Please note where the city and state have varying regulations, the Museum contractors will be advised to follow the more stringent of the two.
- b. Asbestos projects managed by the Facilities Department will:
 - i. Arrange for abatement activities with a licensed contractor.
 - ii. Review the planned work with the EHS Director.
 - iii. Arrange for a licensed "Project Monitor" if required
 1. The "Project Monitor" will be a third party consulting firm licensed to conduct air monitoring and visual inspections.
 2. The "Project Monitor" will air sample for all "Large", "Small" and "Minor" Projects in accordance with the above regulations.

7. MONITORING

- a. Air sampling will occur during "Large", "Small" and "Minor" projects in accordance with city and state regulations by a third party consultant who holds a "Project Monitor" License.
- b. After clearance air samples are received from the third party consultant, staff can re-enter the work area.

8. WASTE

- a. Disposal of asbestos waste shall be properly disposed of in accordance with NYC, NYS and Federal regulations and overseen by the EHS Director.

9. EMERGENCY RESPONSE PROCEDURE

a. Contact Information

- i. For “Large”, “Small” and “Minor” Projects, questions about the project should first be posed to the on-site Project Monitor. If there are any additional questions the Senior EHS Director can be notified at the below numbers for any asbestos questions:
 1. 212-769-5226 - Monday-Friday 9:00 AM –5:00 PM
 2. 212-769-5222 – Off Hours – Control Room can reach Senior EHS Director

b. Response Actions

- i. Once the response by the Senior EHS Director is made, the following decisions will be made:
 1. Does the office/area need to be vacated?
 2. Do signs need to be posted?
 3. Does a contractor need to be hired for clean up?
 4. Does a consultant need to be hired to conduct air sampling?
- ii. If an asbestos contractor needs to be hired for clean-up, EHS and Facilities Departments will make every effort to have the contractor on-site as soon as possible. If required, appropriate agencies will be notified.
- iii. Follow-Up
 1. After an emergency situation is deemed to be over, an evaluation will occur on why the incident occurred and to prevent further incidents.

Acting Commissioner

**Re: American Museum of Natural History Expansion
Block 1130, p/o Lot 1
CEQR # 16DPR004M
New York, NY**

Angela Licata
Deputy Commissioner of
Sustainability

Dear Mr. Wells:

59-17 Junction Blvd.
Flushing, NY 11373

Tel. (718) 595-4398
Fax (718) 595-4479
alicata@dep.nyc.gov

The New York City Department of Environmental Protection, Bureau of Sustainability (DEP) has reviewed the November 2016 Phase I Environmental Site Assessment (Phase I) and the January 2017 Subsurface Phase II Investigation Sampling Protocol (Phase II Work Plan) and Health and Safety Plan (HASP) prepared by AKRF Inc., on behalf of the American Museum of Natural History (applicant/Museum) for the above referenced project. It is our understanding that the applicant is proposing the development of a new five-story building on the Columbus Avenue side of the Museum campus. The new building, The Gilder Center, will be approximately 180,000 gross square feet (gsf) and will require approximately 38,000 gsf of existing space to be renovated to accommodate the expansion. Alterations would also be made to adjacent portions of the Theodore Roosevelt Park. The Museum is located in Theodore Roosevelt Park, which is City-owned parkland under the jurisdiction of the New York City Department of Parks and Recreation (DPR). The project site, Block 1130 p/o Lot 1, is bounded by Columbus Avenue, Central Park West, West 77th Street and West 81st Street in the Upper West Side neighborhood of Manhattan Community District 7.

The November 2016 Phase I report revealed that historical on-site and surrounding area land uses consists of residential, commercial and parkland uses including a museum, a park, public schools, a shooting range, a storage facility, an auto house, a power house, a boiler house, a coal-fired electric power plant as well as residential buildings. Regulatory databases such as the New York State Department of Environmental Conservation (NYSDEC) SPILLS, Leaking Underground Storage Tanks (LUST), Leaking Storage Tanks (LTANKS), Resource Conservation and Recovery Act Generators, and Petroleum Bulk Storage (PBS) Underground Storage Tanks (USTs) and PBS Aboveground Storage Tanks (ASTs) identified several sites in close proximity to the project site. The SPILLS databases reported 590 spills within a 1/2-mile radius of the project site, the PBS USTs and ASTs databases reported a total of 71 sites within a 1/8-mile radius of the project site. Based on the age of the buildings that currently occupies the project site, as well as the electrical equipment observed onsite, polychlorinated biphenyls containing materials, asbestos containing materials and lead based paint could be present in the structures.

The January 2017 Phase II Work Plan proposes to install ten soil borings (SB-1 through SB-10), up to five temporary groundwater wells (GW-1 through GW-5) and seven soil vapor probes (SV-1 through SV-7) at the project site. Soil borings SB-1 through SB-8 will be advanced to approximately 20 feet (ft) below grade (the anticipated maximum depth of excavation for the Gilder Center) or refusal, whichever is encountered first. Soil borings SB-9 and SB-10 will be advanced to approximately 4 ft below grade (the anticipated maximum depth of excavation for the park improvements). If refusal occurs, an additional boring will be advanced in the vicinity of the initial boring to achieve the intended final boring depth. Soil samples will be collected from each boring based on any field observations (e.g., odor and staining) and/or photoionization detector (PID) readings. If no evidence of contamination (visual, odor or PID readings) is apparent, the samples will be collected as follows:

- For deep borings, SB-1 to SB-8, one soil sample will be collected from a 2-foot interval within a historic fill layer and one sample from the 2-foot interval just above the water table or 2-foot interval at the bottom of the soil boring, whichever is encountered first.
- For shallow borings SB-9 and SB-10, advanced in the park, only one soil sample will be collected from the 2-foot interval within a historic fill layer.

Soil and groundwater samples will be collected and analyzed for Target Compound List (TCL) volatile organic compounds (VOCs) by United States Environmental Protection Agency (EPA) Method 8260, TCL semi-volatile organic compounds via EPA Method 8270, pesticides via EPA Method 8081, polychlorinated biphenyls via EPA Method 8082 and Target Analyte List metals (filtered and unfiltered for groundwater samples). Soil vapor samples will also be collected and analyzed for VOCs via EPA Method TO-15.

Based upon our review of the submitted documentation, we have the following comments and recommendations to DPR:

Work Plan

- DPR should instruct the applicant that a minimum of two soil samples should be collected from each deep soil boring (SB-1 to SB-8). One surface soil sample should be collected from 0-2 feet below grade surface (bgs) and one subsurface soil sample should be collected between 2 feet bgs and the maximum proposed excavation depth (based on visual/olfactory evidence of impacts and/or elevated soil screening readings obtained using accepted field instruments). If no evidence or elevated readings are noted during borehole advancement, the subsurface soil sample should be collected from the two foot interval below the proposed maximum excavation depth(s) and/or the groundwater interface (whichever is encountered first).

HASP

- DPR should instruct the applicant to include the name and phone number of an alternate Site Health and Safety Officer in the HASP.
- DPR should instruct the applicant to include a list of other relevant emergency telephone numbers in the HASP (e.g. Local poison control, NYCDEP Hotline).

DEP finds the January 2017 Phase II Work Plan and HASP for the proposed investigation acceptable, as long as the aforementioned information is incorporated into the Work Plan and HASP. DPR should inform the applicant that upon completion of the investigation activities, the applicant should submit a detailed Phase II report to DEP for review and approval. The report should include, at a minimum, an executive summary, narrative of the field activities, laboratory data and conclusions, comparison of soil, groundwater and soil vapor analytical results (i.e., NYSDEC 6NYCRR Part 375, NYSDEC Water Quality Regulations, and New York State Department of Health's October 2006 Guidance for Evaluating Soil Vapor Intrusion in the State of New York), updated site plans depicting sample locations, boring logs, and remedial recommendations, if warranted.

Future correspondence related to this project should include the following CEQR number **16DPR004M**. If you have any questions, you may contact Ms. Cassandra Scantlebury at (718) 595-6756.

Sincerely,

Wei Yu

Flushing, NY 11373

Tel. (718) 595-4398
Fax (718) 595-4422
alicata@dep.nyc.gov

Dear Mr. Wells:

The New York City Department of Environmental Protection, Bureau of Sustainability (DEP) has reviewed the September 2017 Revised Remedial Action Plan (RAP) and Construction Health and Safety Plan (CHASP) prepared by AKRF Inc., on behalf of the American Museum of Natural History (applicant/Museum) for the above referenced project. It is our understanding that the applicant is proposing the development of a new five-story building on the Columbus Avenue side of the Museum campus. The new building, The Gilder Center, will be approximately 203,000 gross square feet (gsf) and will require approximately 42,000 gsf of existing space to be renovated to accommodate the expansion. Alterations would also be made to adjacent portions of the Theodore Roosevelt Park. The Museum is located in Theodore Roosevelt Park, which is City-owned parkland under the jurisdiction of the New York City Department of Parks and Recreation (DPR). The project site is bounded by Columbus Avenue, Central Park West, West 77th Street and West 81st Street in the Upper West Side neighborhood of Manhattan Community District 7.

The September 2017 Revised RAP proposes proper handling, transportation and disposal of excavated materials from the site in accordance with applicable New York State Department of Environmental Conservation (NYSDEC) regulations; dust control procedures; air monitoring procedures; excavated soils that are temporarily stockpiled will be placed on polyethylene sheeting, covered with similar polyethylene sheeting; all found underground and aboveground storage tanks will be properly removed and closed in accordance with applicable NYSDEC regulations; soils displaying petroleum odor and/or staining will be removed and disposed of in accordance with applicable NYSDEC regulations; if dewatering is necessary, a discharge permit will be obtained from the New York City Department of Environmental Protection; capping disturbed areas with concrete, pavement or other impervious layers; the installation of a demarcation layer; the installation of a waterproofing membrane as part of the building's foundation, as well as the installation of two feet of certified clean fill/top soil across portions of the site in any landscaped/grass covered areas of the site not capped with concrete/asphalt.

Based upon our review of the submitted documentation, we have the following comments and recommendations to DPR:

RAP

- DPR should instruct the applicant that the manufacturer's specifications of the proposed waterproofing membrane should be included in the RAP and submitted to DEP for review and approval prior to installation.

DEP finds the September 2017 Revised RAP and CHASP acceptable, as long as the manufacturer's specifications of the proposed waterproofing membrane is submitted to DEP for review and approval. DPR should instruct the applicant that at the completion of the project, a Professional Engineer (P.E.) certified Remedial Closure Report should be submitted to DEP for review and approval for the proposed project. The P.E. certified Remedial Closure Report should indicate that all remedial requirements have been properly implemented (i.e., proper transportation/disposal manifests and certificates from impacted soils removed and properly disposed of in accordance with all NYSDEC regulations; proof of installation of engineering control system, etc.).

Future correspondence related to this project should include the following CEQR number **16DPR004M**. If you have any questions, you may contact Ms. Cassandra Scantlebury at (718) 595-6756.

Sincerely,

Wei Yu
Deputy Director, Hazardous Materials
